

# AWS re:Invent

## Get More Training

Deepen your technical expertise after re:Invent with AWS online and instructor-led courses.

[aws.amazon.com/training](https://aws.amazon.com/training)

#AWSTraining

## Take Hands-On Labs

Practice AWS in a live environment. Choose from 70+ labs, organized by service and use case. Open Tue-Fri.

Free Onsite

## Get AWS Certified Onsite

Validate your AWS expertise. Exams available Mon-Fri. Visit the AWS Certification Information booth to register.

#AWSCertified

## Are you AWS Certified? **AWS Certification Appreciation Reception Public House at the Venetian**

Thursday, October 8  
5-7 PM

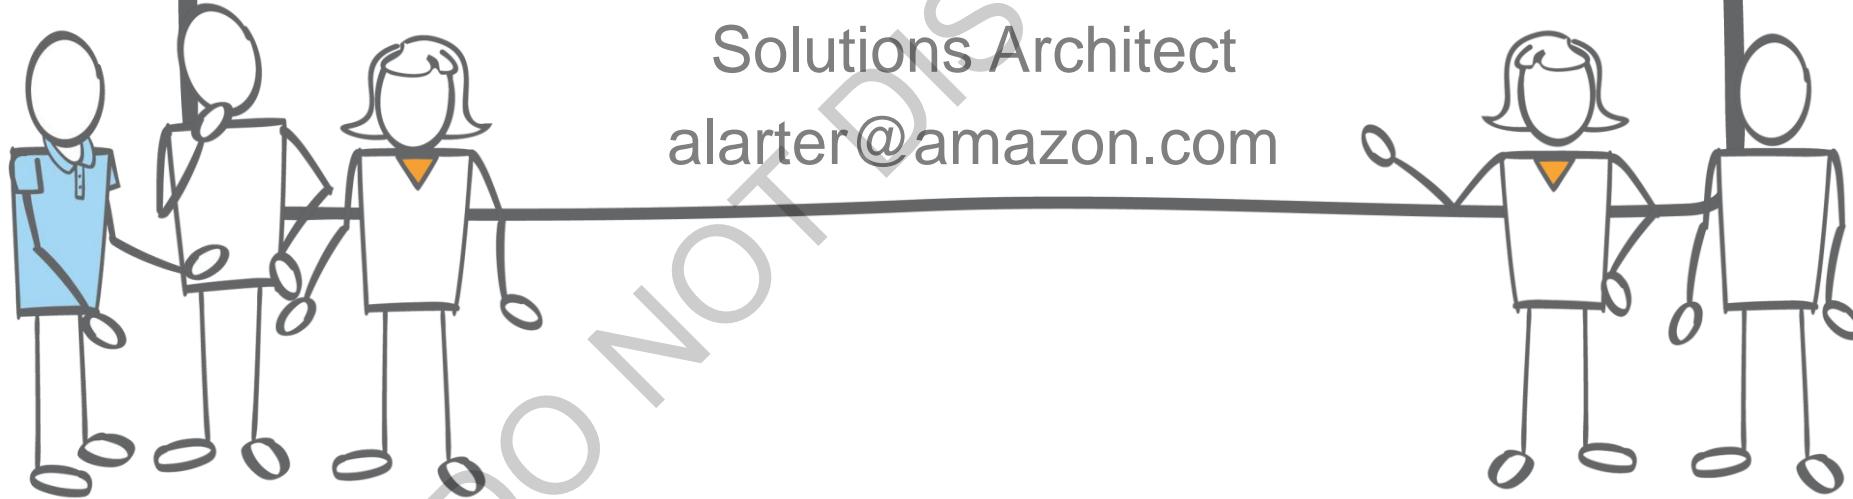

Open to AWS Certified Individuals  
RSVP: <https://aws.amazon.com/reinvent/certified-appreciation-event-2015/>

# Creating applications for Mobile and IoT

Adam Larter

Solutions Architect

[alarter@amazon.com](mailto:alarter@amazon.com)

100 “Things” per second

# The Internet of People

The Internet of Things is here  
on AWS

# The Internet of Connected Devices – IoT & Mobile

## ■ **Mobile devices**

- iOS, Android, Kindle – smart phones and tablets

## ■ **Maker devices**

- Arduinos, Raspberry Pi's, Intel Edison

## ■ **Embedded devices & wearables**

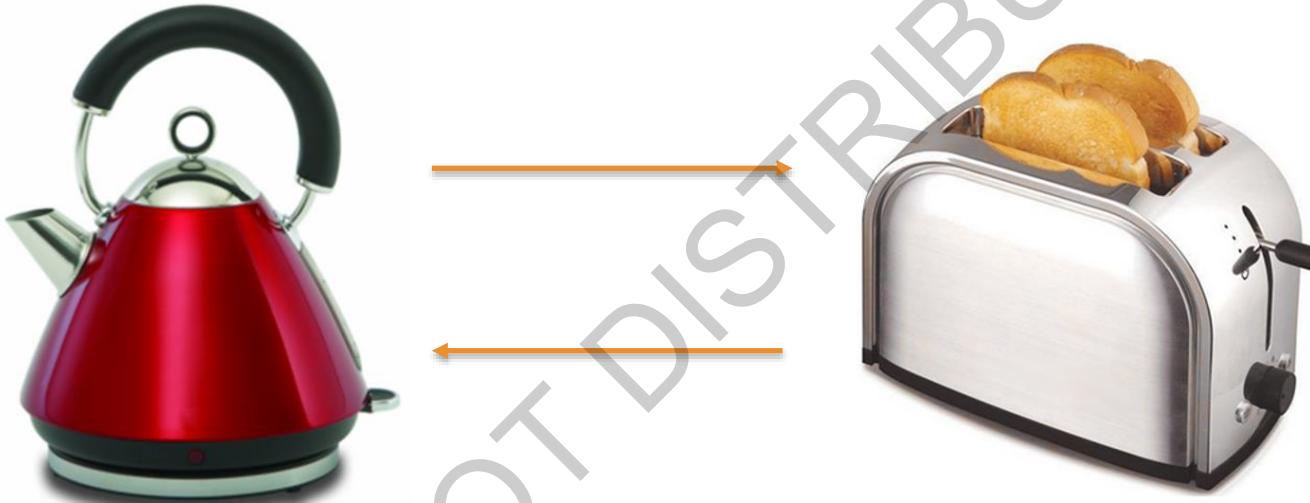

- Health & fitness management, safety & tracking

## ■ **Smart home**

- Smoke alarms, temperature sensors, light globes & switches

On the Internet  
nobody knows you're a toaster

# Our goal: Internet-enabling consumer appliances

# What we will build today

## ■ *Integrated appliance management system*

- Connected appliances – toasters, kettles, etc
- Using Intel Edison IoT devices
- Two-way communication between appliances
- Central website as our device registry
- Companion mobile application to control the system

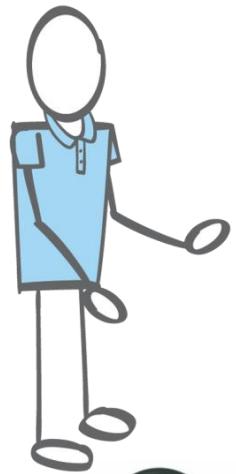

*All this accomplished **without running any compute instances***

We are creating a **system**  
not a simple standalone application...

...so it's going to get  
a little bit **complicated**

# System Overview: Tethering

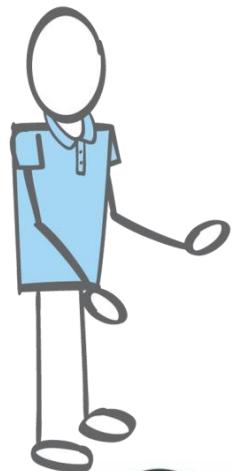

*Bob*

Connected Appliance

*Bob*

## Companion mobile application

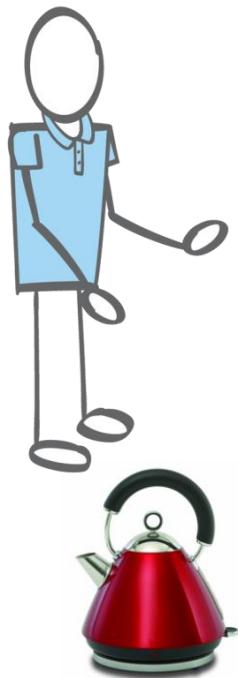

Both the app and the appliance are connected to AWS over WiFi

There is no direct connection between the mobile and the appliance

In order for the mobile app to learn about the presence of the appliance we '**Tether**' them together using a QR code

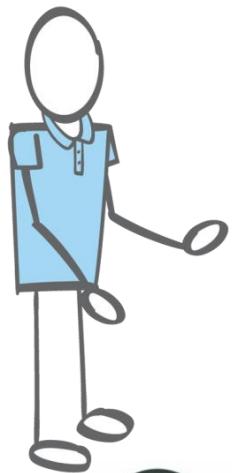

<http://bit.ly/mobile-iot-bootcamp>

The mobile app can receive information from the appliance via AWS and vice versa

# System Overview: Discovery

Bluetooth Low Energy (BLE) advertisements  
used for Discovery and Proximity detection

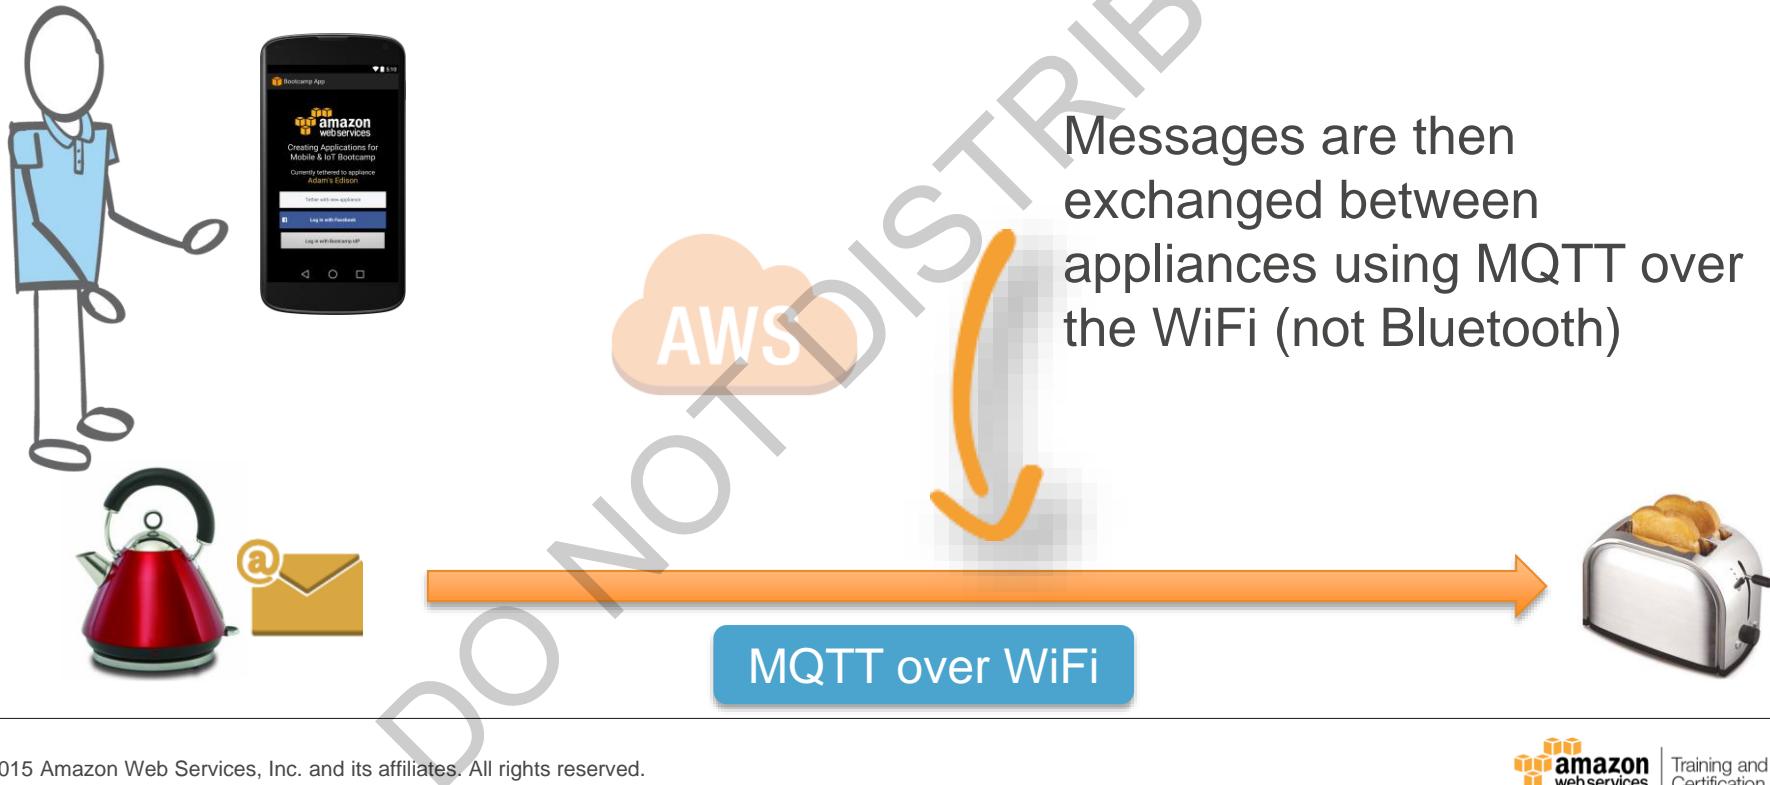

Distance information and other metadata is stored in the AWS Cloud, ready to be accessed by the mobile app

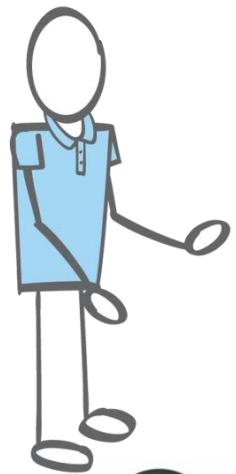

# System Overview: Pairing

# System Overview: Chat

*Bob*

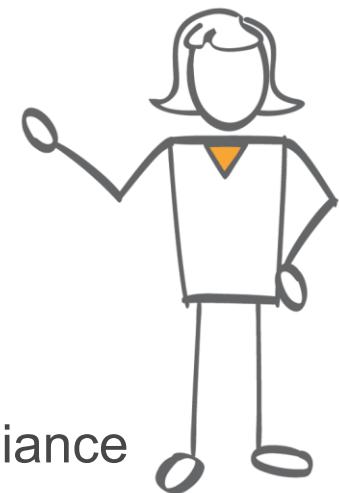

Virtual chat channel

Bob's tethered appliance

*Alice*

Alice's tethered appliance

1

Message is sent from  
app to AWS Cloud

2

AWS Cloud  
forwards  
message to  
appliance

Message sent  
between  
appliances  
using MQTT

MQTT over WiFi

5

Message is received and processed on the mobile app

MQTT over WiFi

4

Message sent to the mobile app via the AWS Cloud

Mobile apps never communicate directly

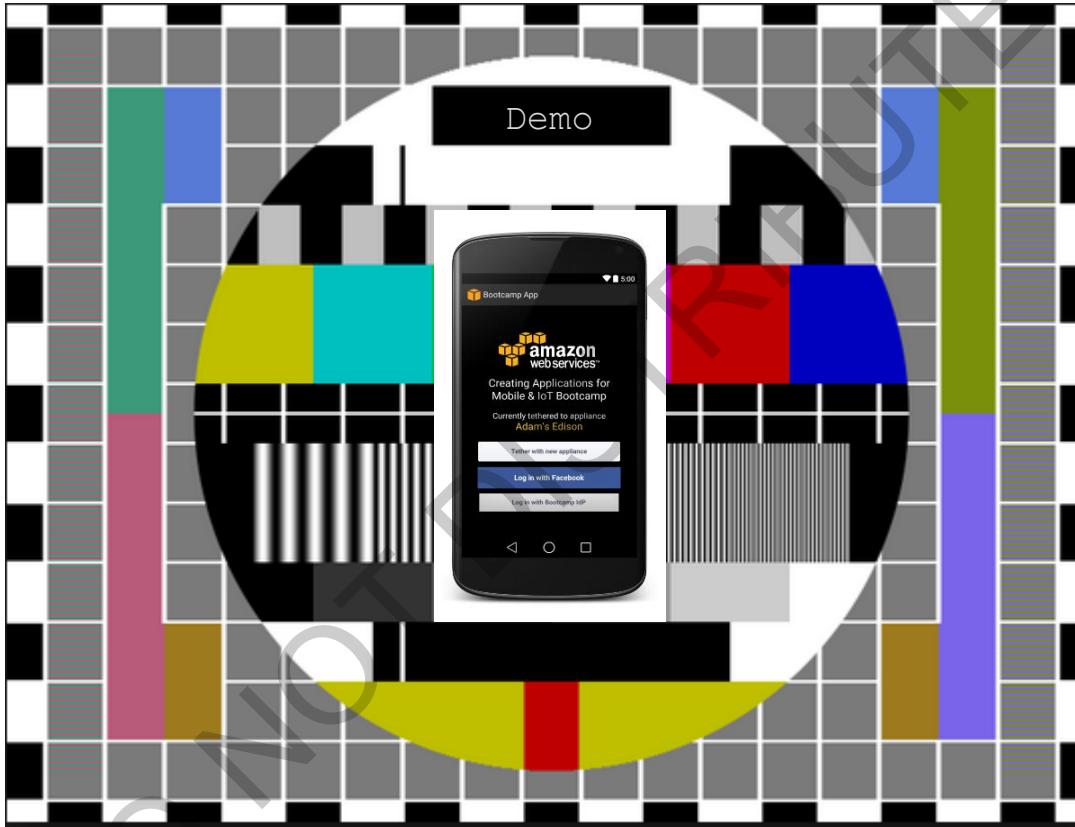

All communication between mobile apps  
passes between the appliances

from and to the AWS Cloud

Mobile apps never communicate directly

All communication between mobile apps  
passes between the appliances

from and to the AWS Cloud

# Internet-enabling appliances using Intel Edison

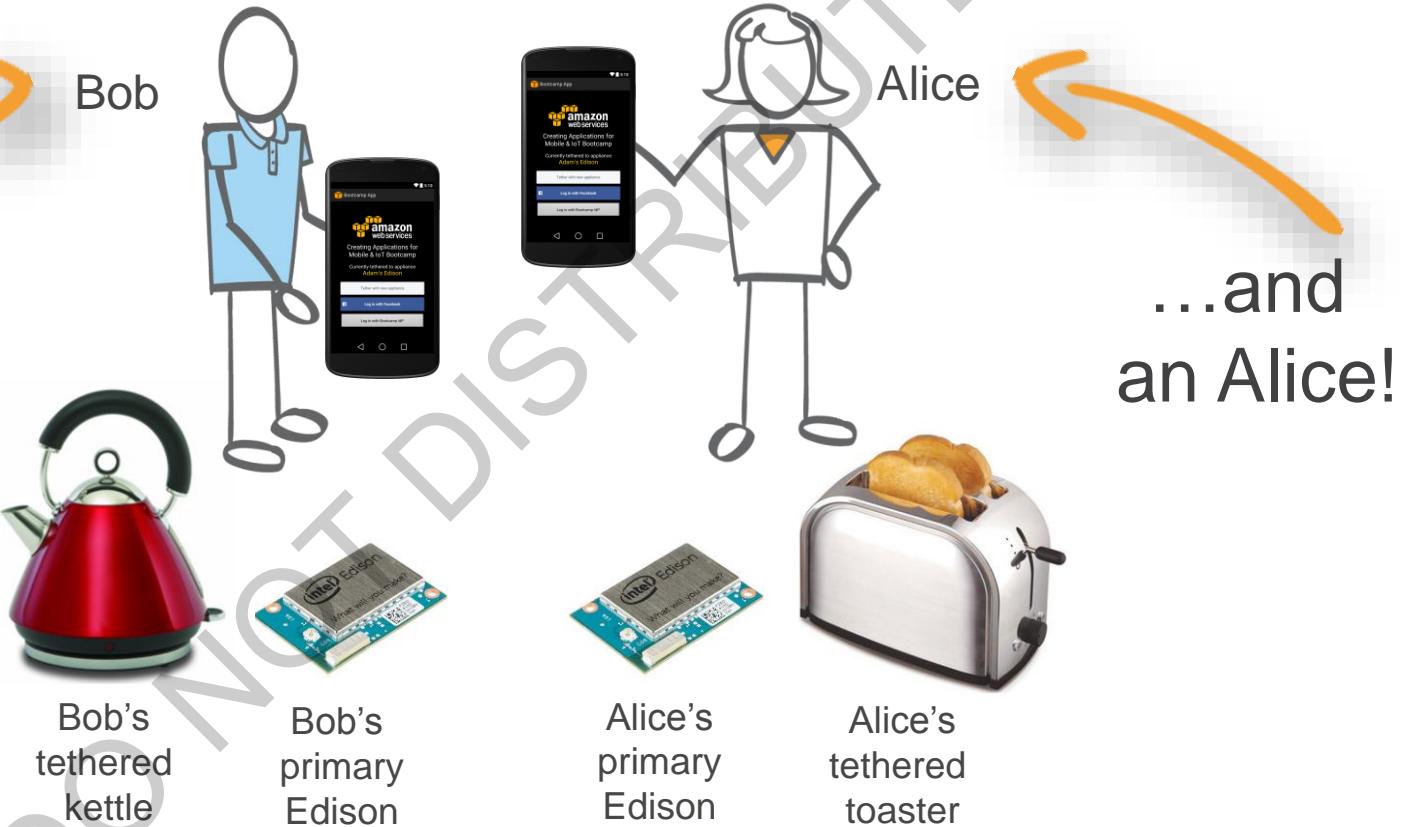

# Introducing the Intel Edison

- Dual-core 500 MHz Atom CPU
- 4 GB storage
- 1GB RAM
- Yocto Linux
- WiFi 802.11 a/b/g/n
- Bluetooth 4.0

# We will work in pairs

Everyone  
is a Bob!

# Our system specification

## Appliances

- Represented by Intel Edison devices
- Appliances implemented in NodeJS code
- Discover each other using Bluetooth Low Energy advertisements – the Bluetooth 4.0 specification
- Continually send telemetry data to the AWS cloud
- Accept commands from the user via the AWS cloud
- Send commands to other devices via MQTT
- Send responses to the user via the AWS cloud

# Our system specification

## Companion mobile app

- Log in using our own Identity Provider (FB optional)
- Dynamically ‘tether’ to an appliance (Edison)
- Show list of appliances nearby our tethered appliance
- Chat between one mobile app and another app – communication sent via the two tethered Edison appliances
- Control panels for each appliance
- Analytics in the mobile app to capture custom events, in-app purchases and user stickiness

# Our system specification

## Central web site

- Central repository for appliance configuration
- Automatically updated by Edison at startup
- Creates QR code to allow the user to scan from the companion mobile application to 'tether' the mobile app to an appliance

<http://bit.ly/mobile-iot-bootcamp>

# AWS services we will use in our system

Amazon Cognito

## Identity & data synchronization

Determine if a device or user is allowed to do something  
Share state between multiple instances of the app

AWS Lambda

## Event-driven architecture

Running code in response to events in the system

# AWS services we will use in our system

AWS IAM

## Identity & Access Management

Secure, fine-grained control of cloud resources

Amazon Kinesis

## Telemetry

High-velocity data stream containing BLE detection data

Amazon SQS

## Commands

Issuing commands to the appliance (chat/pair)

# AWS services we will use in our system

Amazon  
DynamoDB

## ❖ Shared data store

High throughput NoSQL store for our detection data

Amazon SNS  
Mobile Push

## ❖ Push notification & synchronization

Chat messages and other commands  
in-bound to the mobile app

Amazon  
API Gateway

## ❖ API Gateway

Our custom authentication mechanism will be implemented  
as Lambda functions exposed via the Amazon API gateway

# Services used for Appliance Detection

Authorization

DONOTDISTRIBUTE

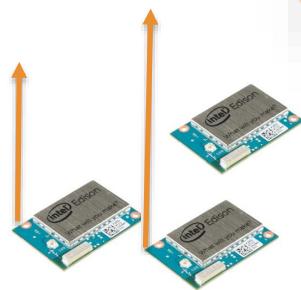

# Services used for Appliance Detection

Amazon

(Secondaries)

Detection

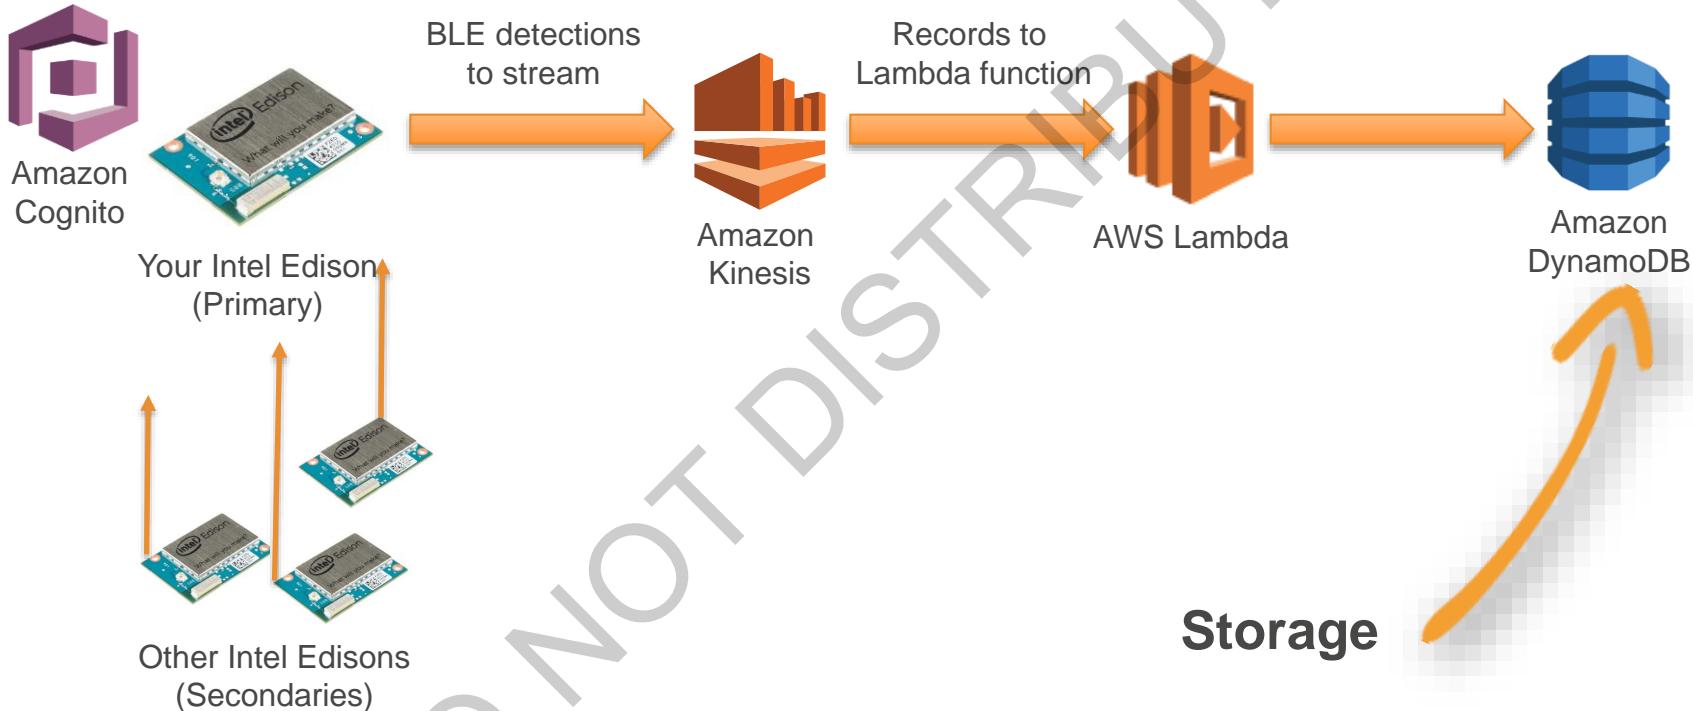

# Services used for Appliance Detection

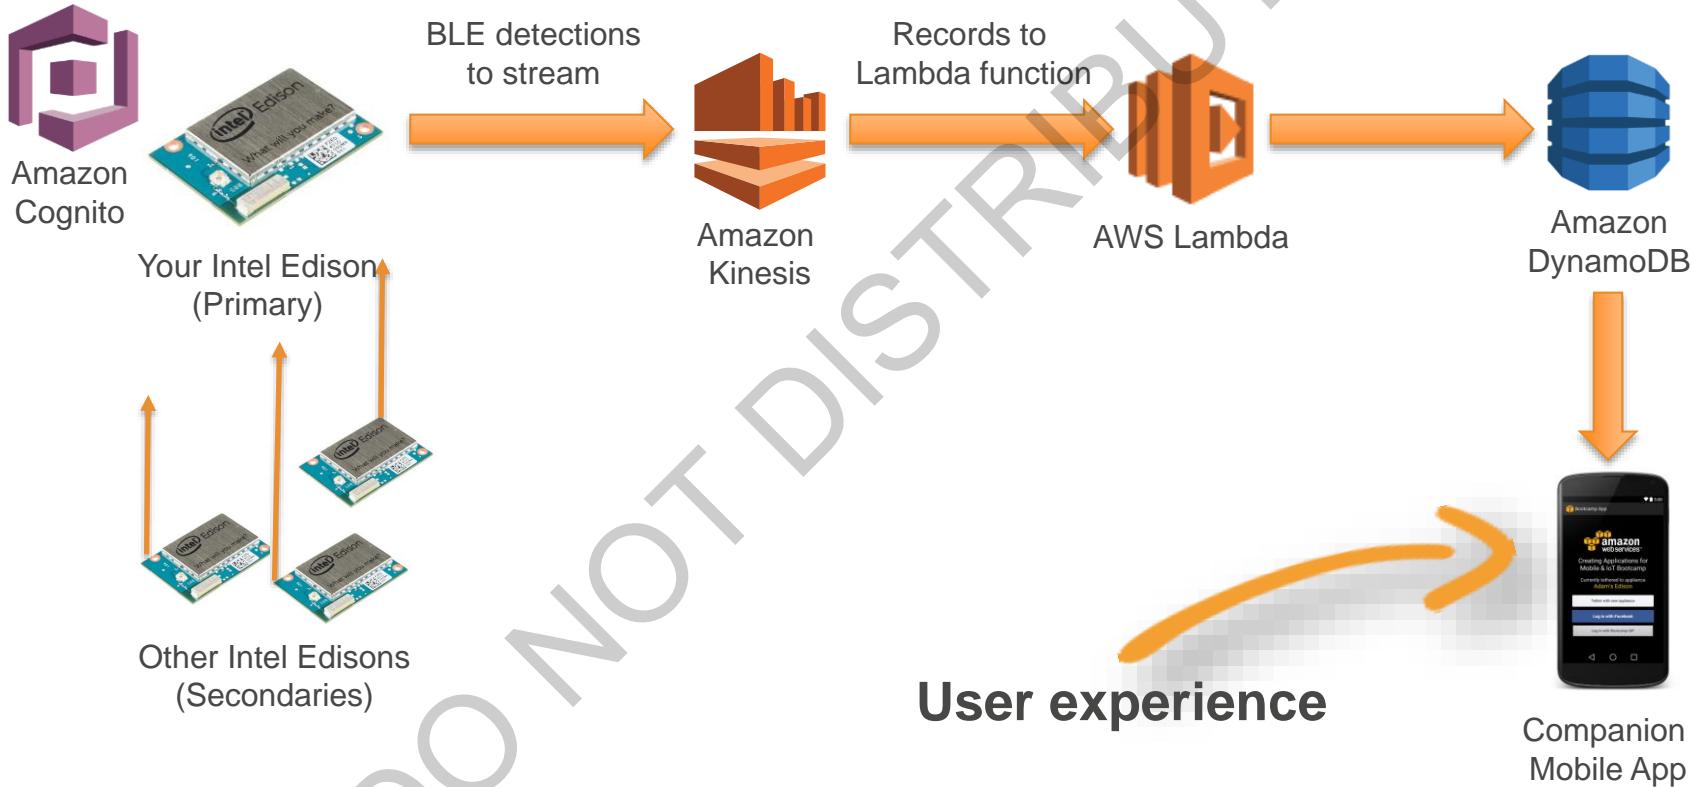

# Services used for Appliance Detection

# Services used for Appliance Detection

# Services used for Appliance Detection

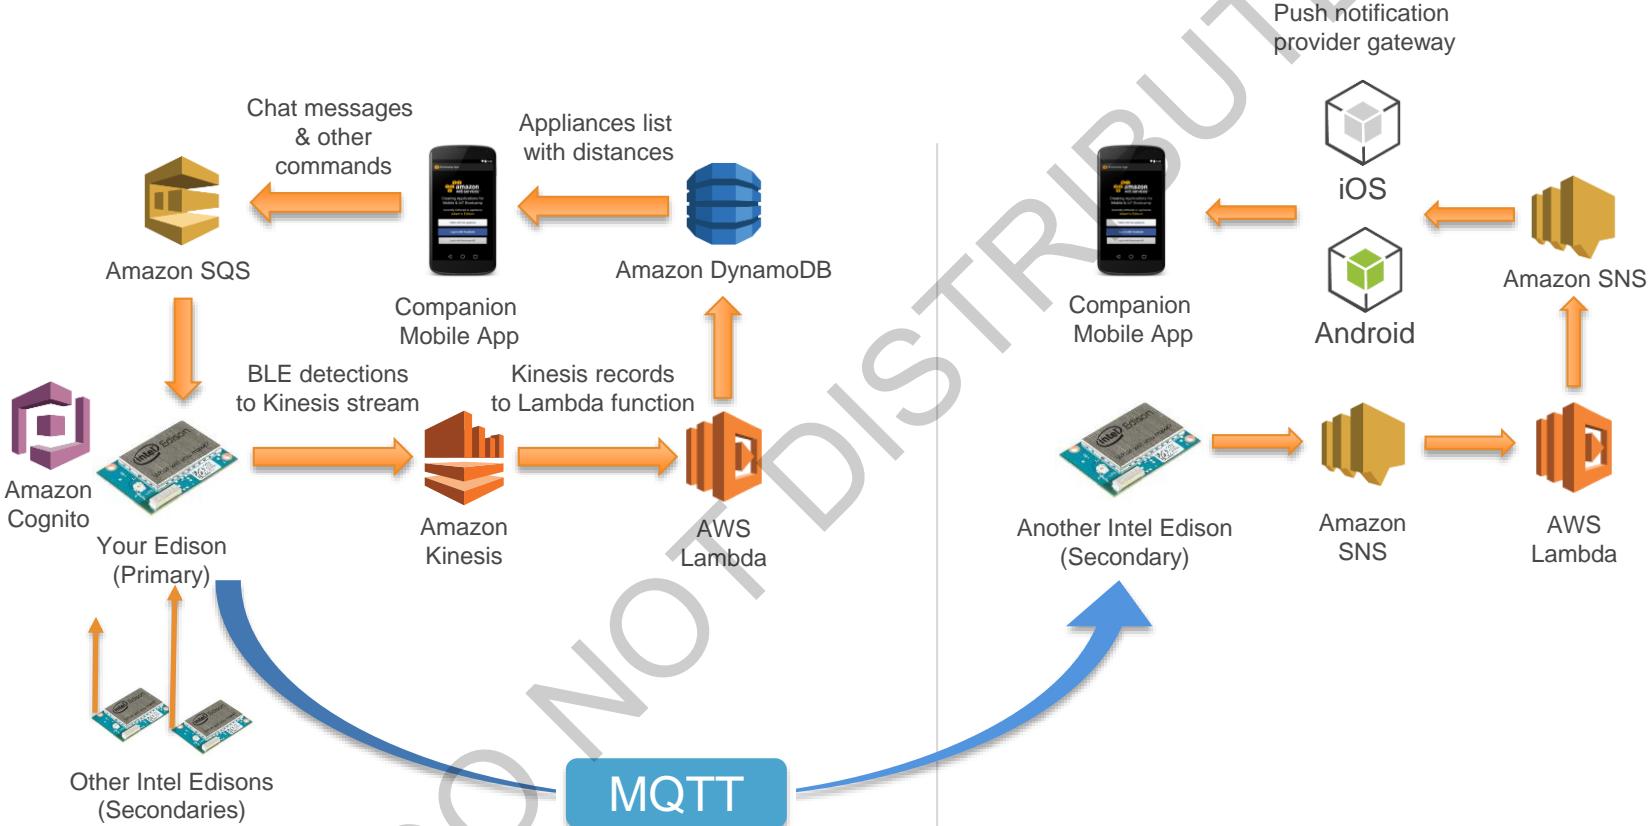

# System design & architecture

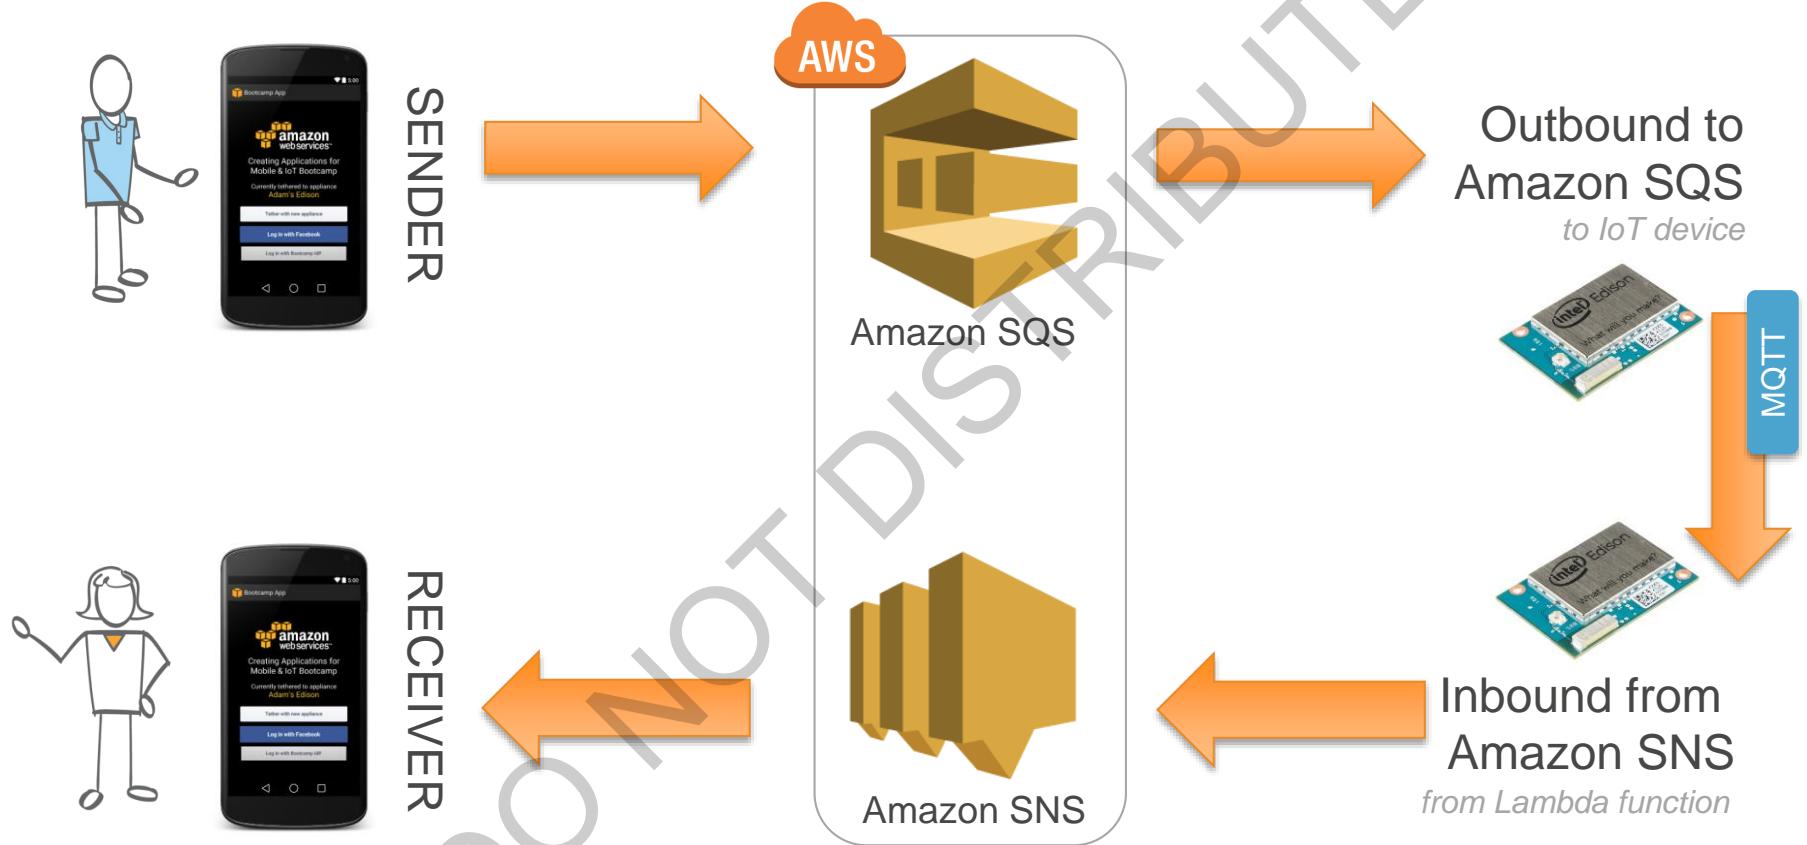

Integrated Appliance Management System

# System architecture

# Data-flow is easy to remember!

Bluetooth is only used for  
**Discovery/Proximity**

MQTT over WiFi is used for  
**cross-appliance communication**

HTTP over WiFi is used for  
**everything else!**

# Mobile & IoT Challenges

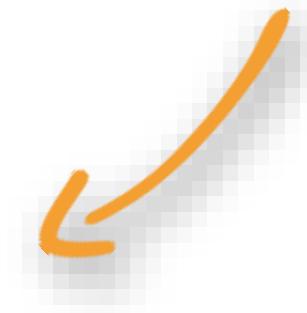

How AWS meets the challenges

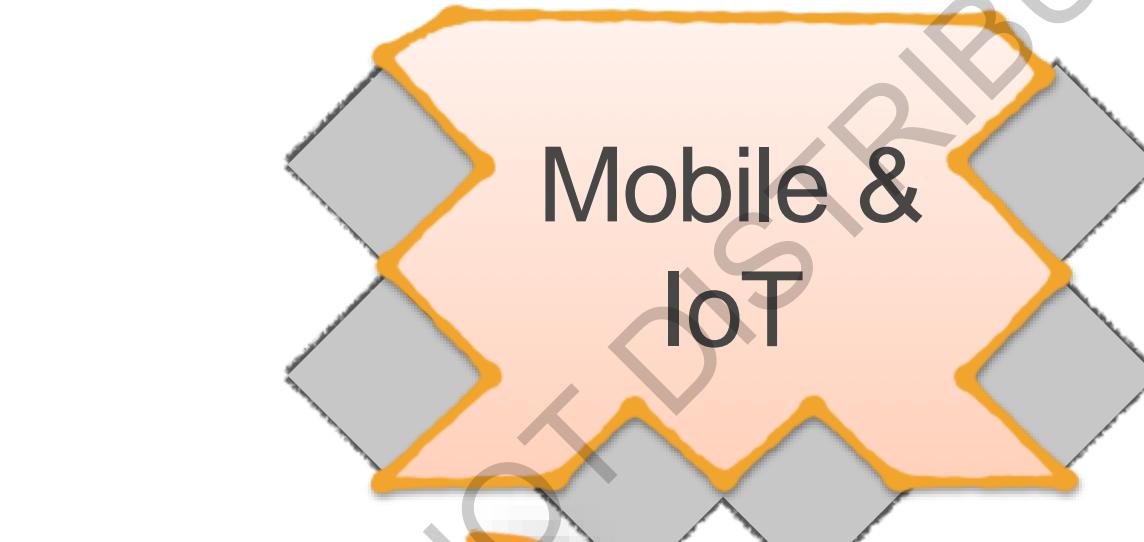

# IoT & Mobile challenges

- Devices constrained in at least one computing dimension
- Regularly deployed at counts in the thousands, millions or more
- May have minimal human interface or human operator interaction

Computers...  
not just  
'dumb sensors'

# Resource constrained computing gaps

# AWS helps fills the gaps in IoT/Mobile

# IoT challenges

## Authorization

Determine if a device should be allowed to do something

## Telemetry

Remotely determining what a device senses

## Commands

Issuing commands to the remote device

What about **Mobile** applications?

## Authenticate users

Manage users and identity providers

## Authorize access

Securely access cloud resources

## Synchronize data

Sync user prefs across devices

## Analyze User Behavior

Track active users, engagement

## Track Retention

Manage funnels, Campaign performances

## Store and share media

Store user-generated photos  
Media and share them

## Deliver media

Automatically detect mobile devices  
Deliver content quickly globally

## Send push notifications

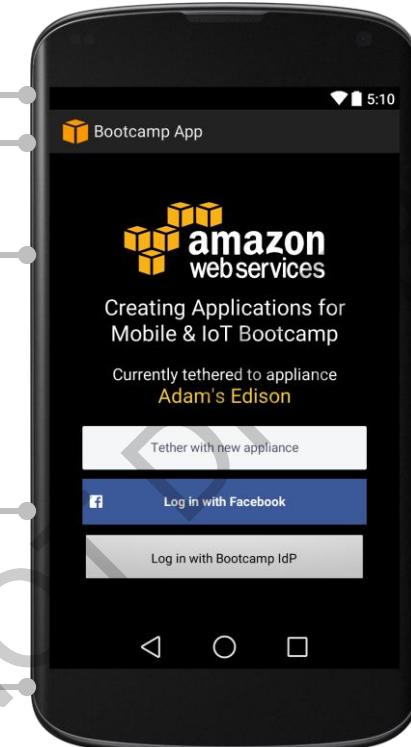

Bring users back to your app by sending messages reliably

## Store shared data

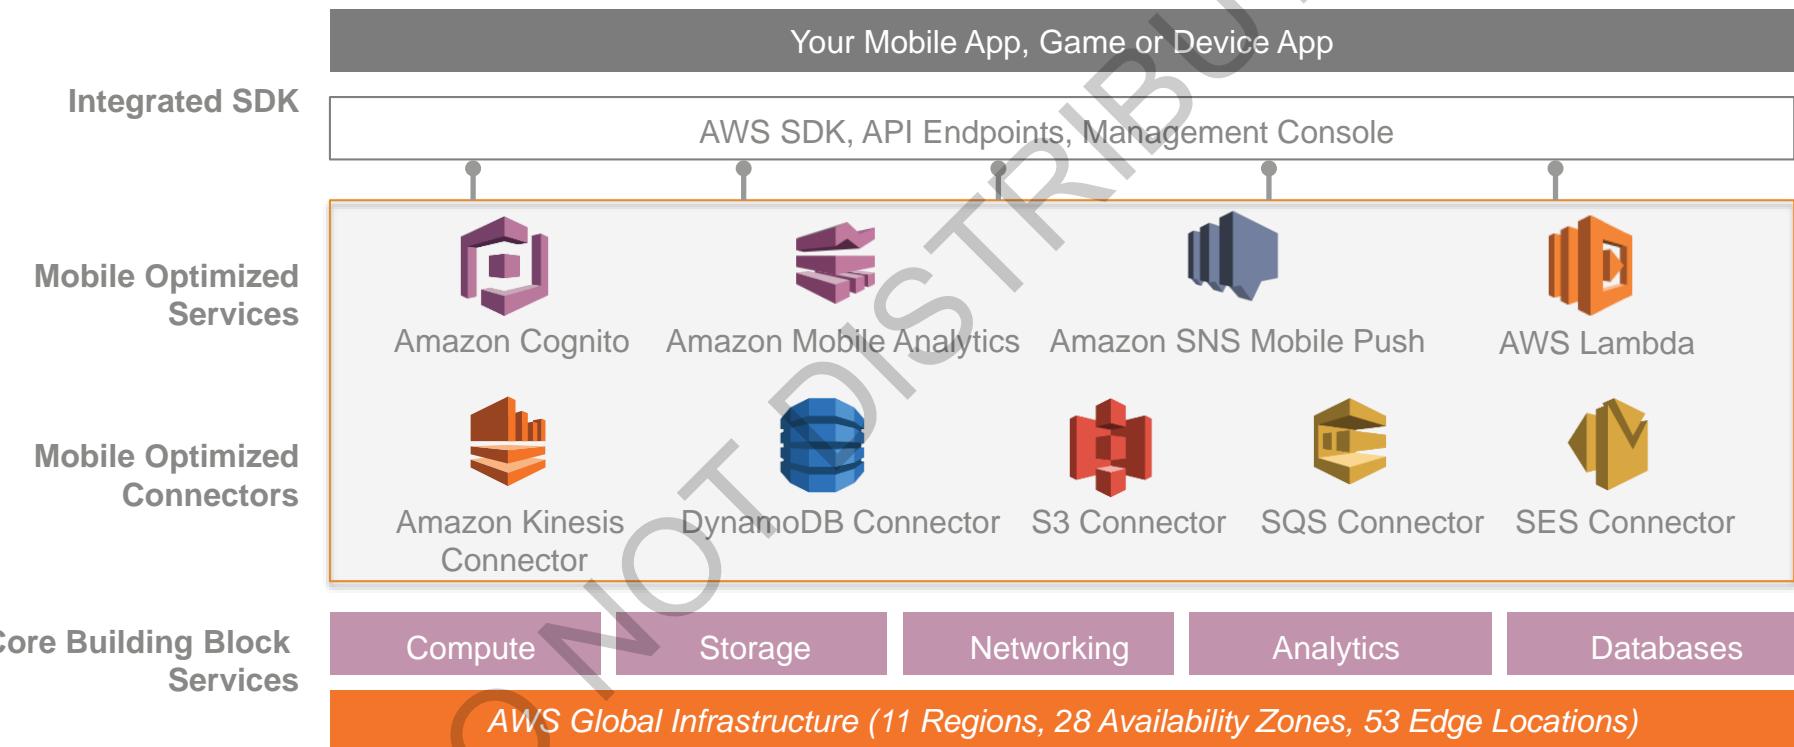

Store and query fast NoSQL data across users and devices

## Stream real-time data

Collect real-time clickstream logs and take actions quickly

# AWS Services for Mobile & IoT

# AWS Mobile SDKs

Fully-integrated AWS mobile SDK

Cross-platform, optimized  
for native mobile OS

Automatically handles intermittent  
and latent network

Reduced memory footprint

Common authentication  
method across all services

iOS

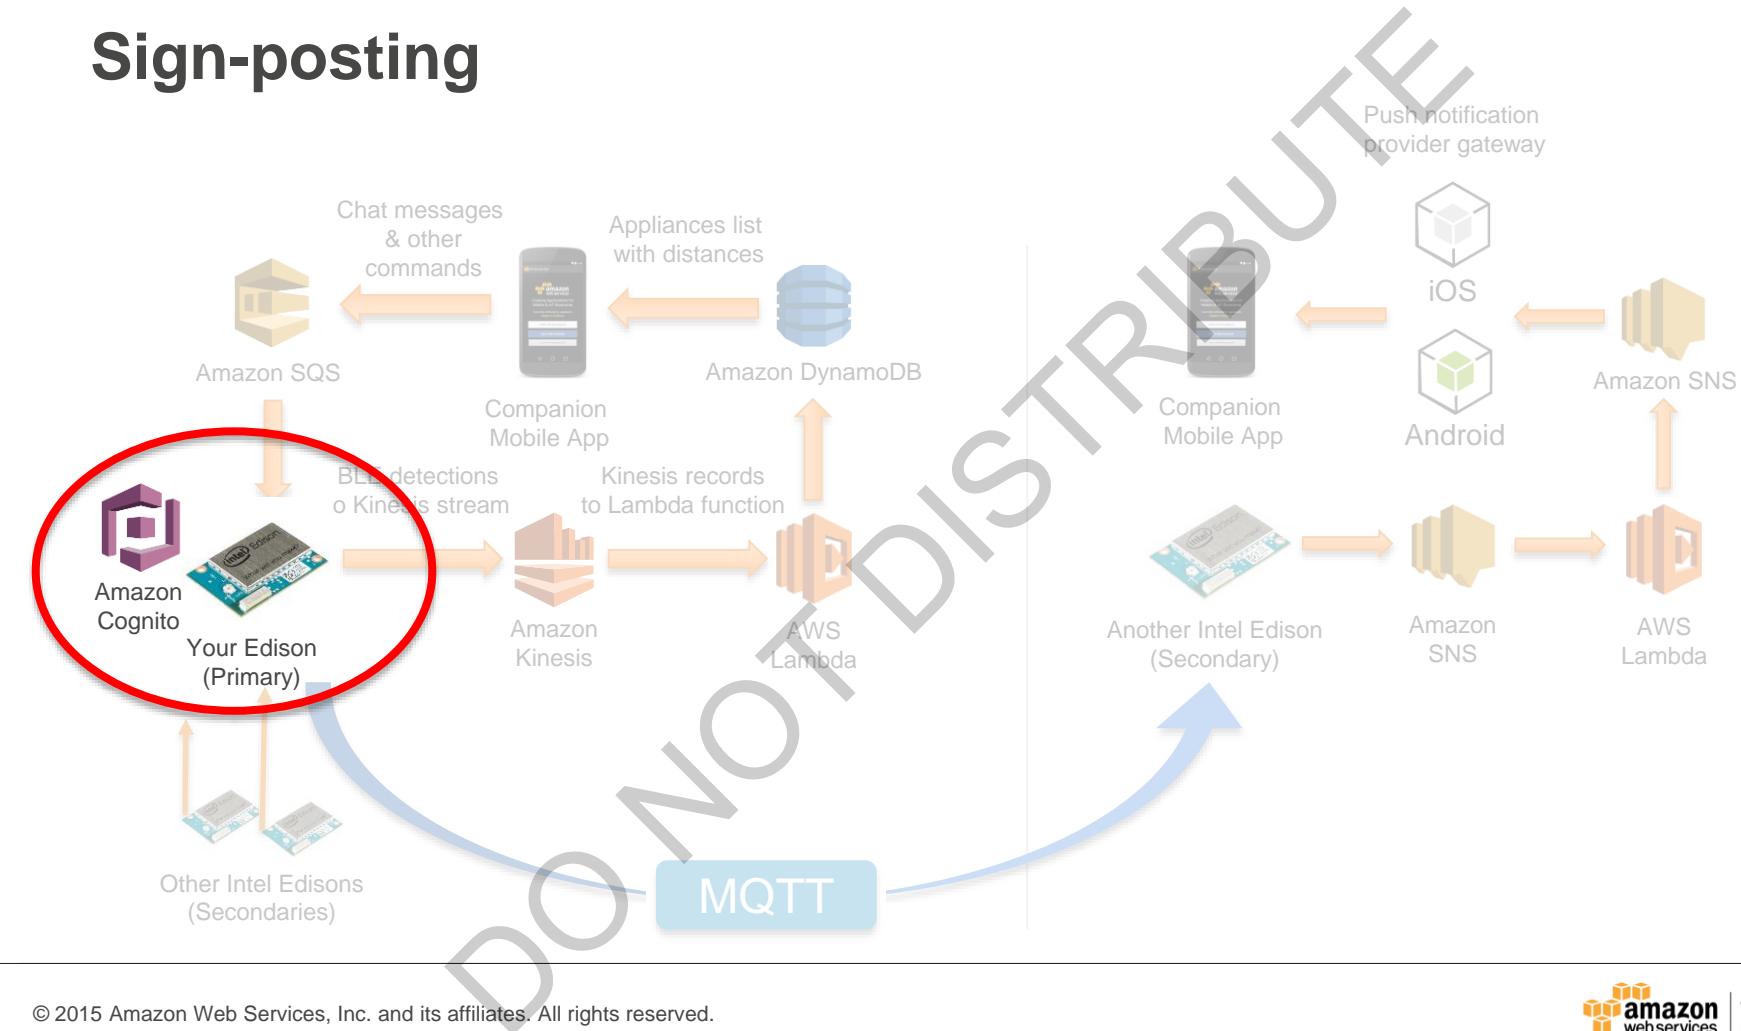

Android

# Part 1

Authorization, Telemetry & Edison

# Sign-posting

# Amazon Cognito

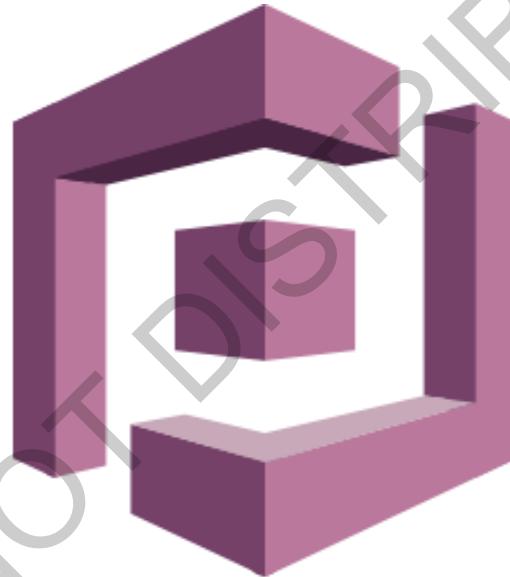

Introduction to Amazon Cognito  
& our first Lab

# Amazon Cognito – two sides

Amazon Cognito  
Identity Broker

Amazon Cognito  
Sync Store

Authorization & Synchronization

# Amazon Cognito - authorization

- **Simplifies security - Integrated with IAM Roles**

Fully-integrated with IAM for security

- **Supports multiple Login Providers**

Easily integrate with major login providers (FB, Google+, Login with Amazon) and supports Open ID Connect for authentication – or create your own Identity Provider

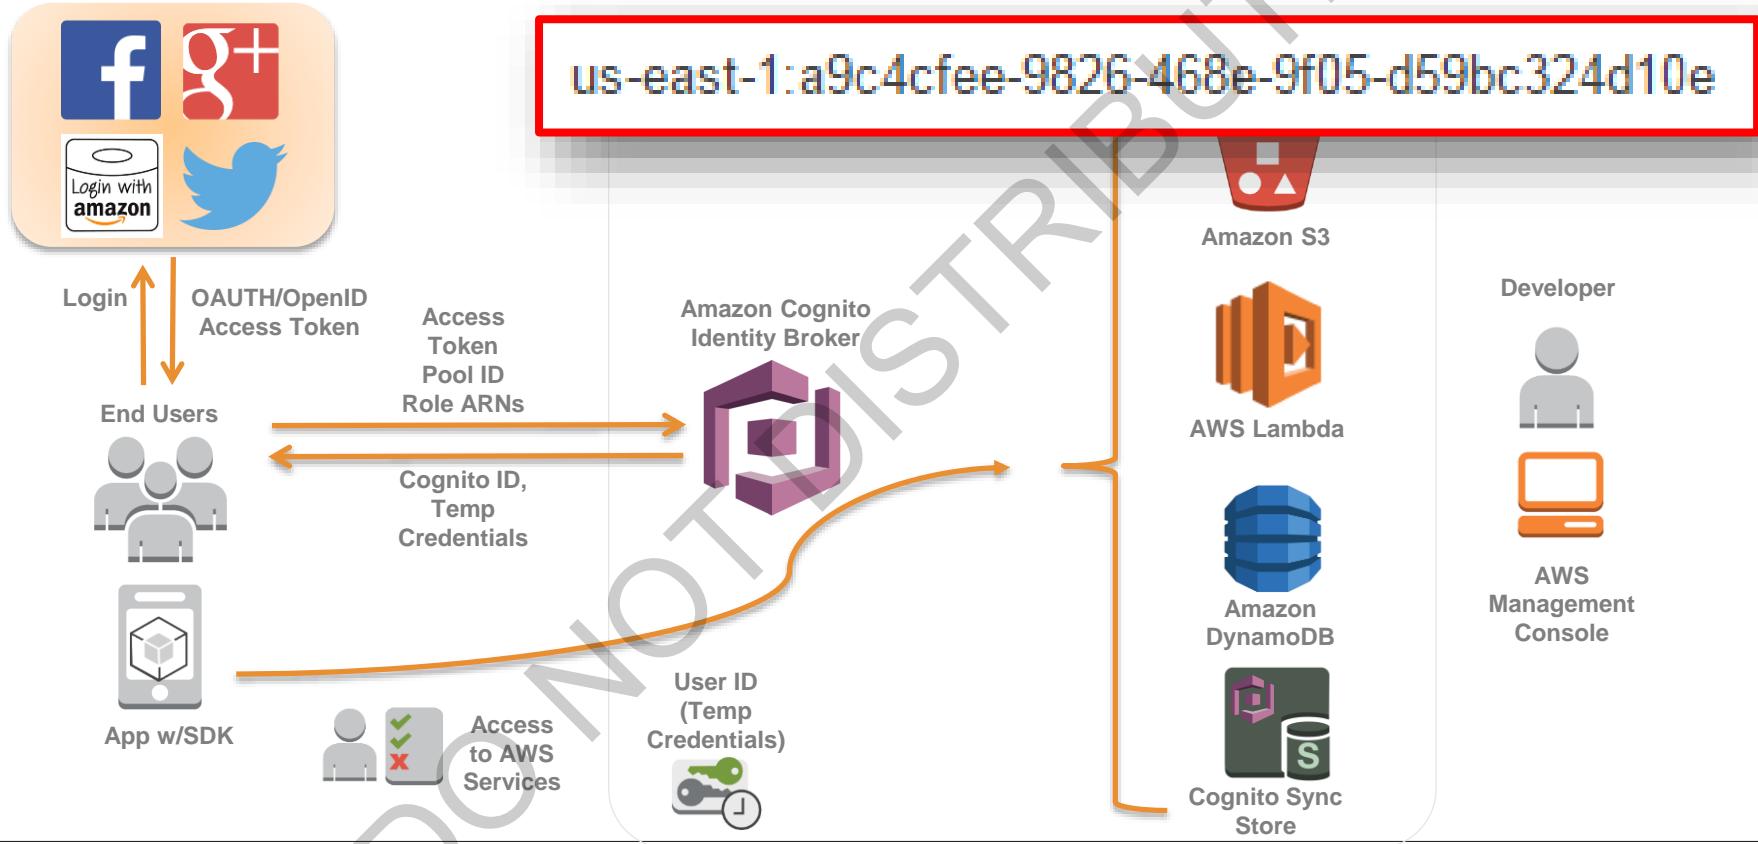

- **Supports un-authenticated ‘guests’**

Your users can be authorized if you choose

# Amazon Cognito – data synchronization

- **Cross-device and Cross-platform Push Sync**  
Synchronize user's data across devices and platforms
- **Amazon Cognito Streams feature**  
Automatically stream changes in user data to Amazon Kinesis for processing
- **Sync Trigger – Amazon Cognito Event**  
to intercept changes in Amazon Cognito dataset
- **Programmatic access to sync store**  
Run back-end processes that modify in-app data

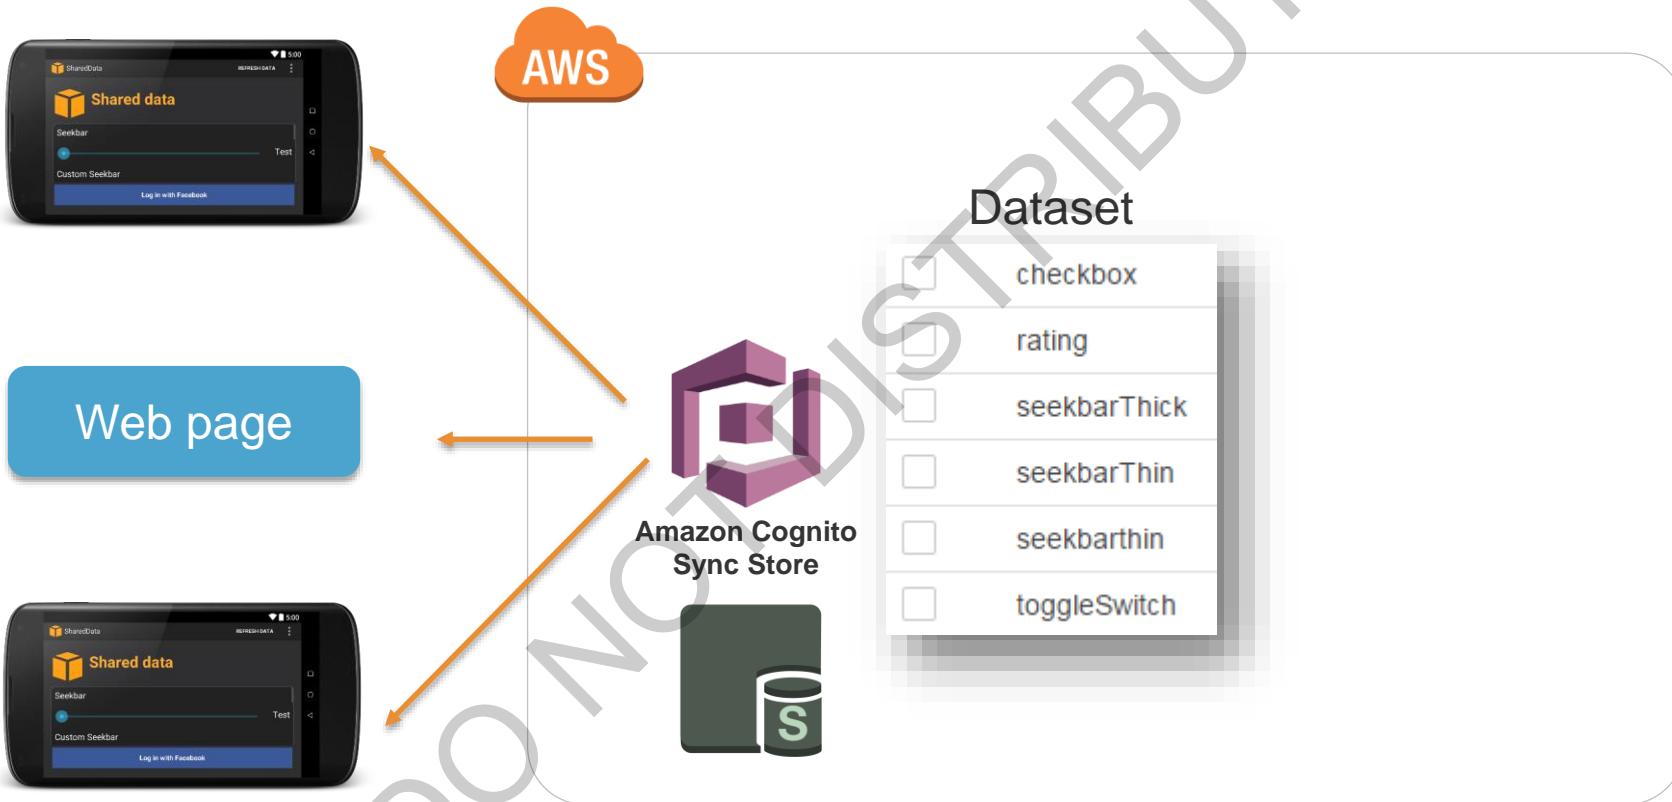

# Amazon Cognito Security Architecture

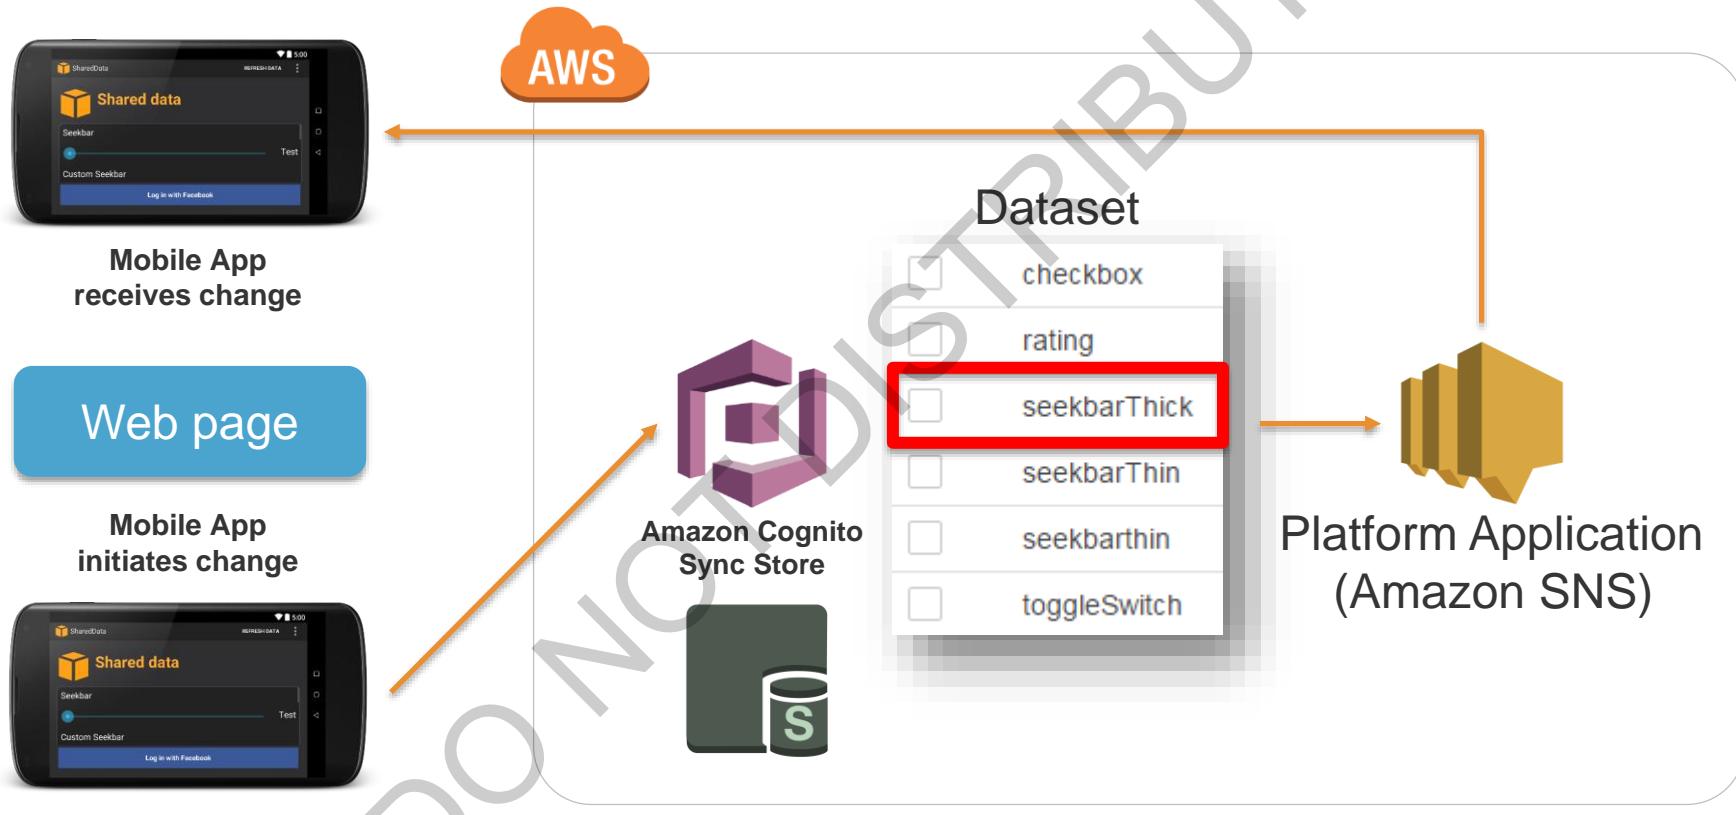

# Amazon Cognito – push sync

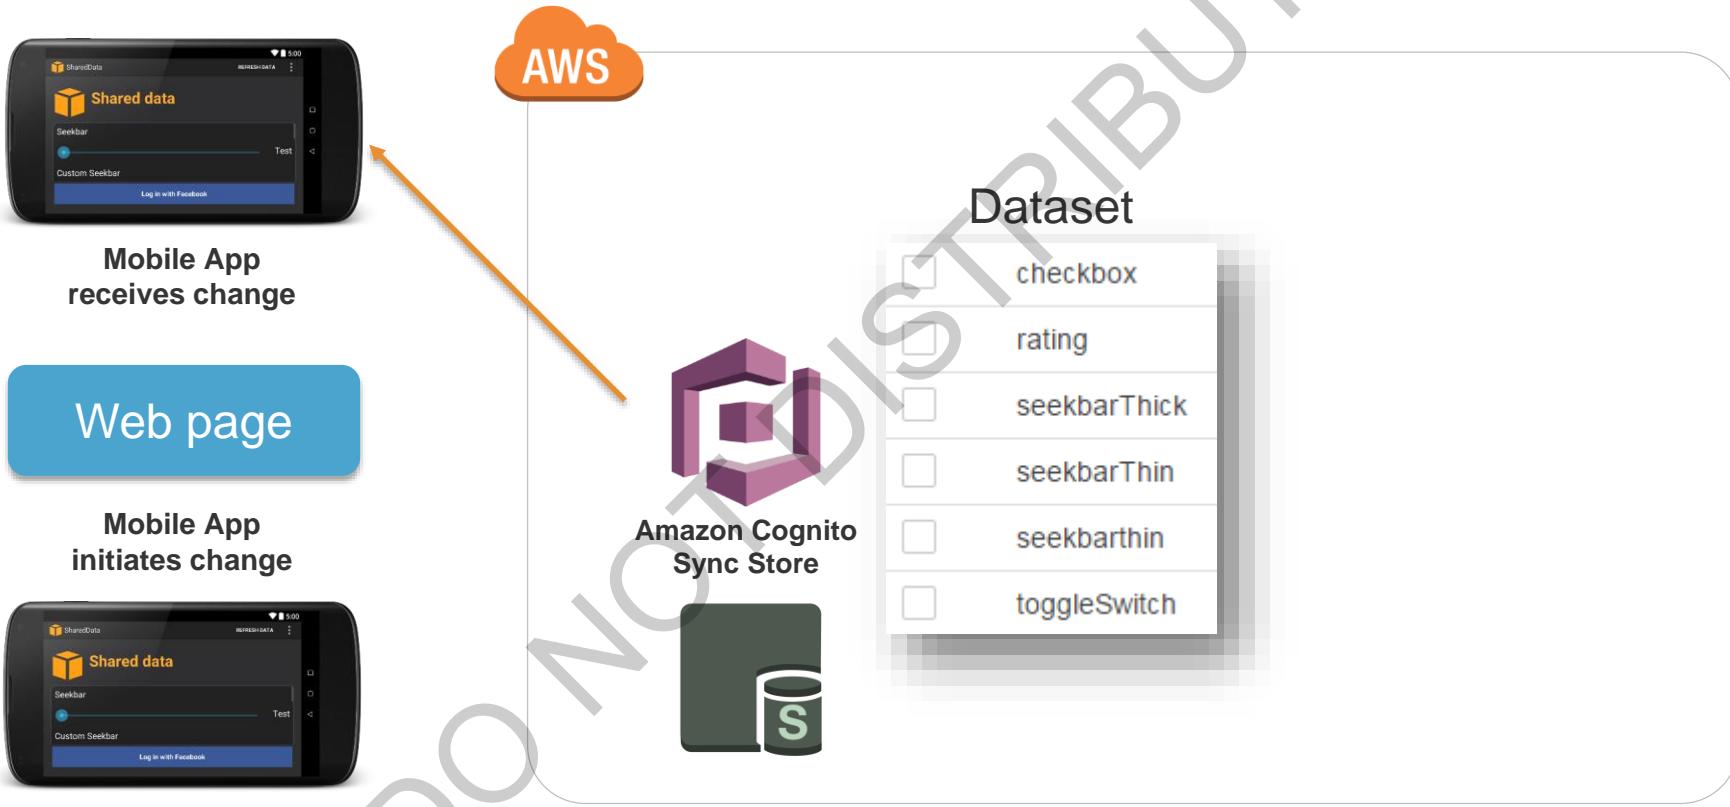

# Amazon Cognito – push sync

# Amazon Cognito – push sync

# Amazon Cognito – push sync

For our mobile  
app...

...and IoT device!

In our system we use **Amazon Cognito** ↗  
to manage authorized access  
to all cloud resources, via **AWS IAM Roles**

# Amazon Cognito

Accessing the Amazon Cognito Sync  
Store from a web page

# Amazon Cognito from your web page

```
function setupCognito(oauthToken)
{
    var params =
    {
        AccountId      : bootcampConfig.AWS_ACCOUNT_ID,
        IdentityPoolId : bootcampConfig.COGNITO_IDENTITY_POOL_ID
        RoleArn        : bootcampConfig.COGNITO_ROLE_AUTH;
        Logins         :
        {
            'graph.facebook.com' : oauthToken
        }
    }

    AWS.config.region = bootcampConfig.COGNITO_REGION;
    AWS.config.credentials = new AWS.CognitoIdentityCredentials(params);

    AWS.config.credentials.get(function(err)
    {
        if (!err)
        {
            var cognitoId          = AWS.config.credentials.identityId;
            var cognitoSyncClient = new AWS.CognitoSyncManager();
        }
    })
}
```

# Amazon Cognito from your web page

```
function setupCognito(oauthToken)
{
    var params =
    {
        AccountId      : bootcampConfig.AWS_ACCOUNT_ID,
        IdentityPoolId : bootcampConfig.COGNITO_IDENTITY_POOL_ID
        RoleArn        : bootcampConfig.COGNITO_ROLE_AUTH;
        Logins         :
        {
            'graph.facebook.com' : oauthToken
        }
    }

    AWS.config.region = bootcampConfig.COGNITO_REGION;
    AWS.config.credentials = new AWS.CognitoIdentityCredentials(params);

    AWS.config.credentials.get function(err)
    {
        if (!err)
        {
            var cognitoId      = AWS.config.credentials.identityId;

    }
});
});
```

# Amazon Cognito

Highlights of  
Amazon Cognito Identity Pool  
setup Lab

# Create a new Amazon Cognito Identity Pool

## Getting started wizard

### Step 1: Create identity pool

Step 2: Set permissions

### Create new identity pool

Identity pools are used to store end user identities. To declare a new identity pool, enter a unique name.

Identity pool name\* Bootcamp2015 

Example: My App Name

#### ▼ Unauthenticated identities

Amazon Cognito can support unauthenticated identities by providing a unique identifier and AWS credentials. If your application allows users who do not log in, you can enable access for unauthenticated identities.

Enable access to unauthenticated identities

# Create a new Facebook Application

The screenshot shows the Facebook Developers interface. The top navigation bar includes links for Developers, My Apps, Products, Docs, Tools & Support, and News. The 'My Apps' tab is selected, displaying a list of applications. The first application in the list is 'Bootcamp2015'. The main content area shows the 'Basic' settings for this app. The 'App ID' field contains the value '1612926948954230', which is highlighted with a red rectangular box. Other visible fields include 'Display Name' (set to 'Bootcamp2015') and 'App Domains' (empty). On the left side, there is a sidebar with links for Dashboard, Settings (which is currently selected), Status & Review, App Details, and Roles.

# Assign the Facebook Id to the identity pool

## ▼ Authentication providers i

Amazon Cognito recognizes tokens from these public identity providers. If you allow your users to auth application identifiers here. Warning: Changing the application id your identity pool is linked to will pre Learn more about public identity providers.

**Amazon** **Facebook** **Google+** **Twitter** **OpenID** **Custom**

**Facebook App ID** 1612926948954230

Example: 7346241598935555

# Create new AWS IAM Roles

▼ Hide Details

**Role Summary**

<b>Role Description</b>	Your authenticated identities would like access to Cognito.
<b>IAM Role</b>	<input type="button" value="Create a new IAM Role"/>
<b>Role Name</b>	Bootcamp2015-Cognito-Authenticated

▶ View Policy Document

**Role Summary**

<b>Role Description</b>	Your unauthenticated identities would like access to Cognito.
<b>IAM Role</b>	<input type="button" value="Create a new IAM Role"/>
<b>Role Name</b>	Bootcamp2015-Cognito-UnAuthenticated

▶ View Policy Document

## IAM Roles

Just use the default privileges assigned by the IAM Role Creation Wizard when you create these roles

*But rename the roles as mentioned in the lab guide!*

# Test Amazon Cognito in your web browser

Cognito Identity: us-east-1:79ecc0db-181b-46f2-b6ff-28f25e2c7534

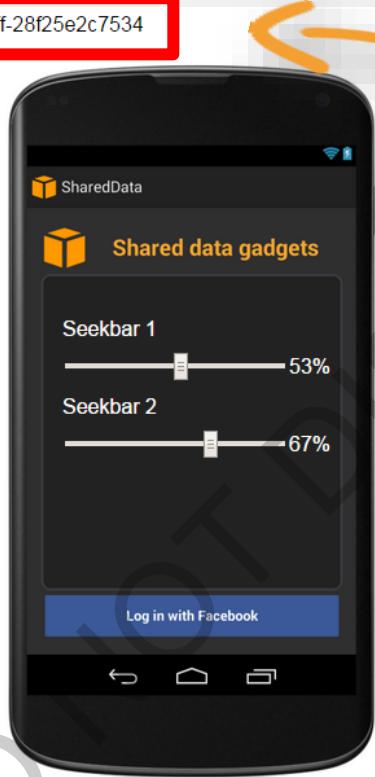

[Connect with Facebook](#)  
[Disconnect from Facebook](#)

Cognito Sync completed

Cognito Sync

[Synchronize Data](#)

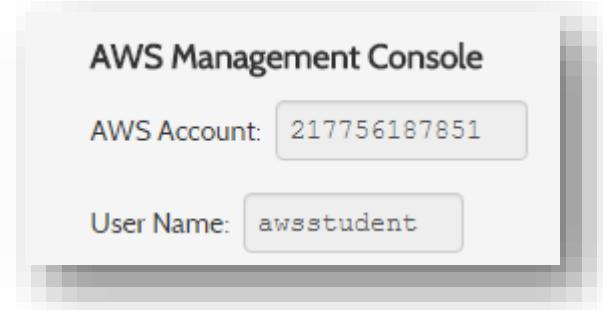

Your Amazon Cognito Identity Id

In this application, we show the Amazon Cognito Identity Id in the web page to make it easier for you to make a manual change to the shared data later in the Lab

# Edit the configuration file

```
//////////  
//  
// Replace the "xxxxxxxxxxxx" in the  
// line below, to be your Qwiklabs Account Id  
// without any dashes  
//  
// It will look something like this "217756187851"  
//  
//////////  
  
this.AWS_ACCOUNT_ID          = "XXXXXXXXXXXXXX";  
  
//////////  
//  
// Replace the "xxxxxxxxxxxx" in the  
// line below, to be the Cognito Identity pool Id  
// exactly as it is shown in the AWS Console  
//  
// It will look something like this "us-east-1:223e168c-5ddk  
//  
//////////  
  
this.COGNITO_IDENTITY_POOL_ID = "XXXXXXXXXXXXXX";
```

Replace this with your AWS Account Id you are using in Qwiklabs

# Edit the inline configuration

```
//////////  
//  
// Replace the "xxxxxxxxxxxx" in the  
// line below, to be your Qwiklabs Account Id  
// without any dashes  
//  
// It will look something like this "217756187851"  
//  
//////////  
  
this.AWS_ACCOUNT_ID          = "XXXXXXXXXXXXXX";  
  
//////////  
//  
// Replace the "xxxxxxxxxxxx" in the  
// line below, to be the Cognito Identity pool Id  
// exactly as it is shown in the AWS Console  
//  
// It will look something like this "us-east-1:223e168c-5ddk  
//  
//////////  
  
this.COGNITO_IDENTITY_POOL_ID = "XXXXXXXXXXXXXX";
```

Replace this with the Amazon Cognito Identity Pool's ID – you cut and paste that from the AWS console after you have created the Identity Pool

# Modify shared data

Identities

Search by Identity ID  Search

**Find the identity in the  
Amazon Cognito Sync Store**

Using the Amazon Cognito Identity Id,  
we will find the shared data for this  
identity and modify it

# Modify shared data

Make changes to the data

We will make changes to the shared data and then see the updated values in the web page

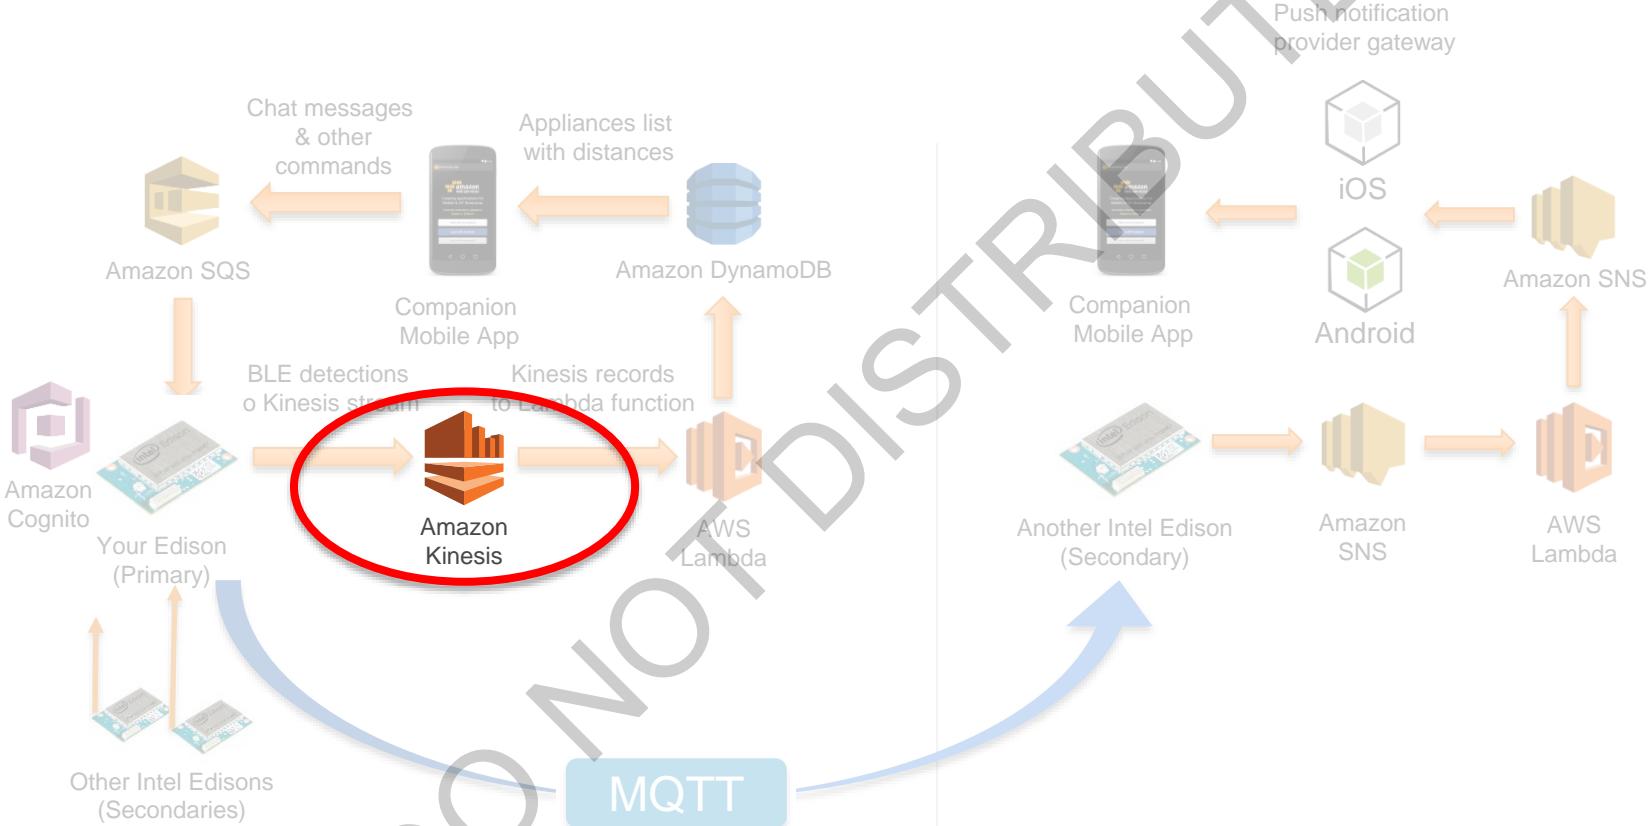

# LAB 1

Set Up Amazon Cognito Identity Pool

Test Amazon Cognito Sync in the Browser

# Sign-posting

# Amazon Kinesis

Collect and process large streams of  
data records in real time

# What is telemetry streaming?

## ▀ Sensor networks

High-velocity and low-velocity telemetry data streams from sensors and devices (like our appliances!)

## ▀ Ad network analytics & click streams

Tracking and monitoring ad views and user interaction in the digital space as they click around web pages

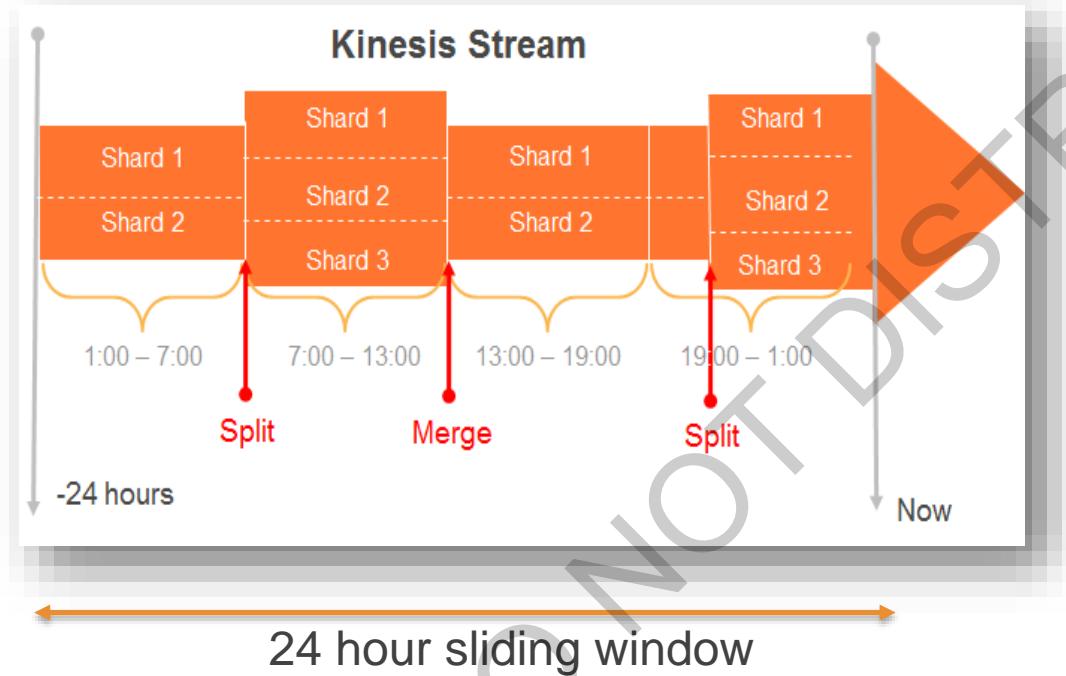

## ▀ Log shipping and centralization

In-bound log data sent to a central store for analysis, alerting, etc

# When to use stream processing

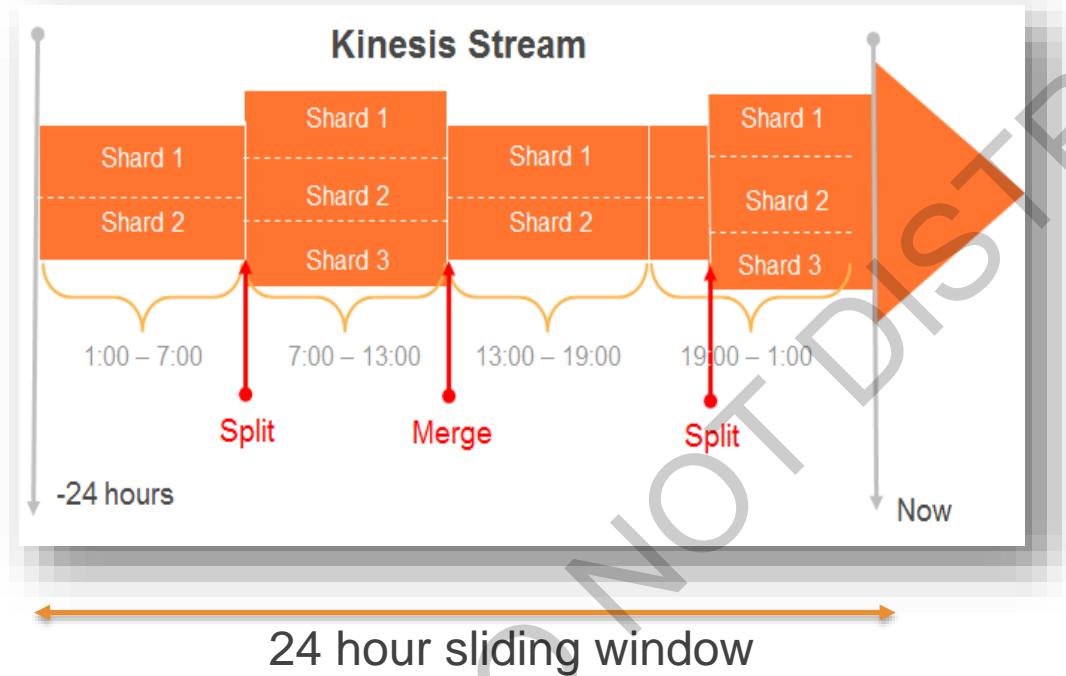

- You need ‘Real-time’ responses to telemetry data  
In-bound telemetry needs to be dealt with just-in-time or real-time
- Batch processing won’t suffice  
Your use case can’t afford to wait for batch processing done asynchronously
- Records can be thrown away after processing  
The records are just a means to an end – can be archived after processing has been completed

# Amazon Kinesis - concepts

- Streams are made of Shards
- Each shard ingests < 1mbps of data and emits < 2mbps
- All captured data is stored for 24 hours
- You can scale streams by splitting or merging Shards

# Amazon Kinesis - concepts

- Producers use a **PUT** call to store data in a **Stream**.  
(Each record <= 50KB)
- A **Partition Key** is supplied by producer and used to **distribute** the PUTs across **Shards**
- You can have multiple **Amazon Kinesis consumers** operating on the stream at the same time – independently
- We will implement the **Amazon Kinesis consumers** as **Lambda functions**

# Amazon Kinesis features

- **Scale shards elastically**

- Scale Up or Down without losing sequencing

- Scale up to GB/sec (using multiple **shards**) without losing durability

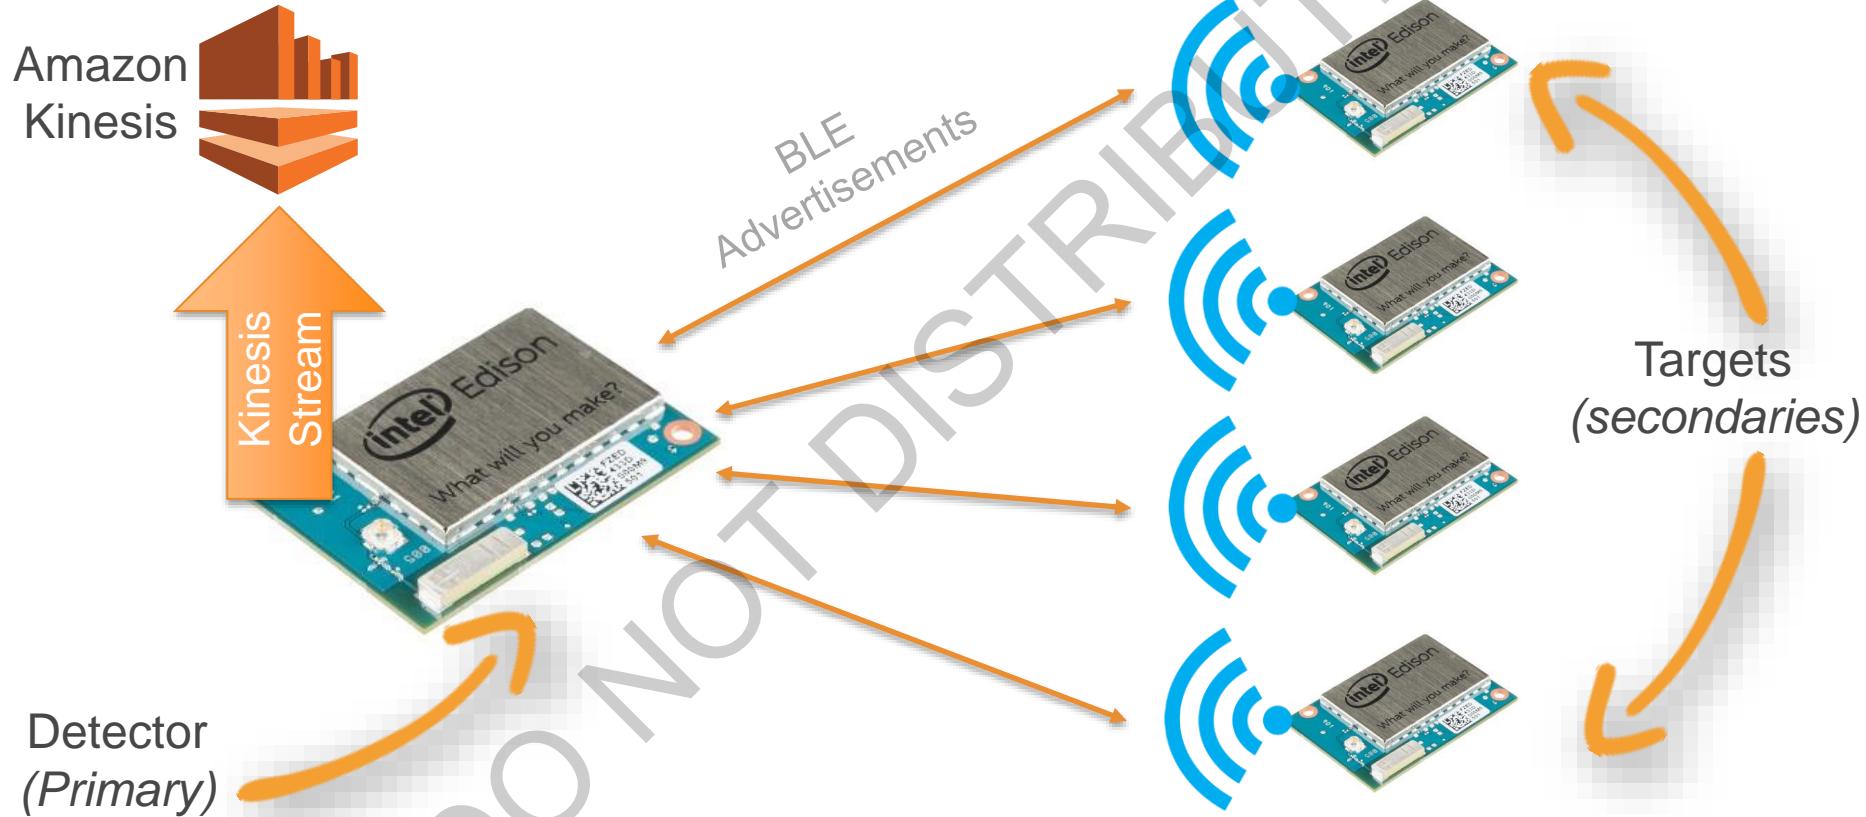

- **Data accessible for 24 hours**

- Workers/processors have access to data for 24 hours

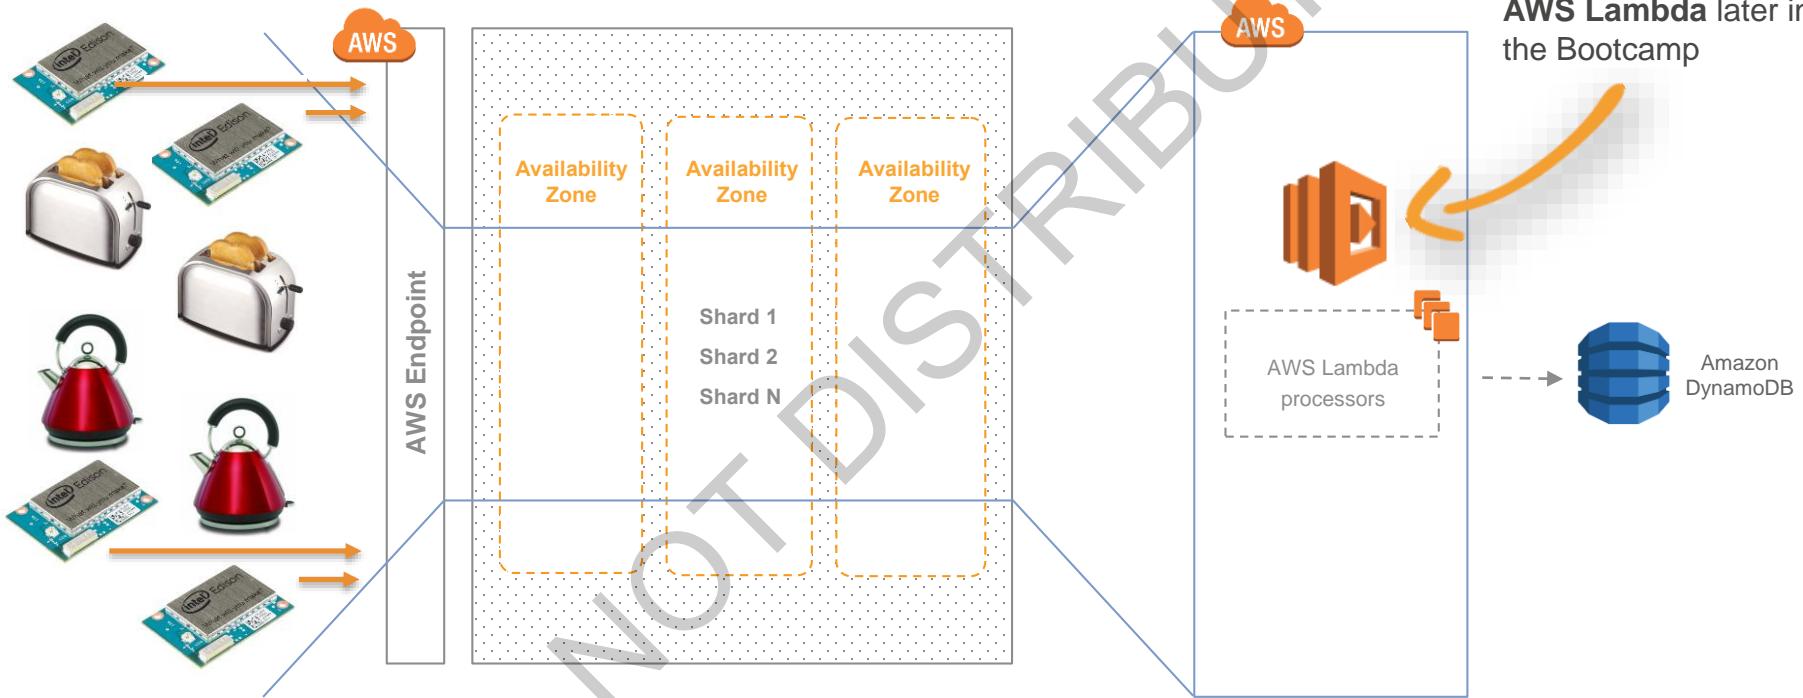

- **Process high-velocity data in parallel**

- Multiple producers, multiple shards, multiple independent consumers

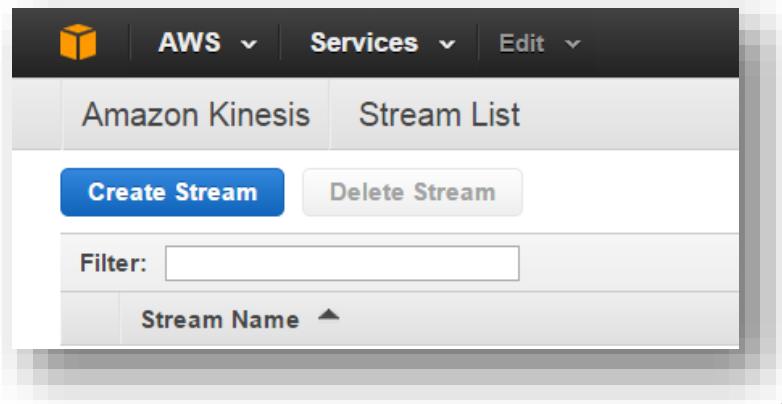

# How Amazon Kinesis relates to our appliance network

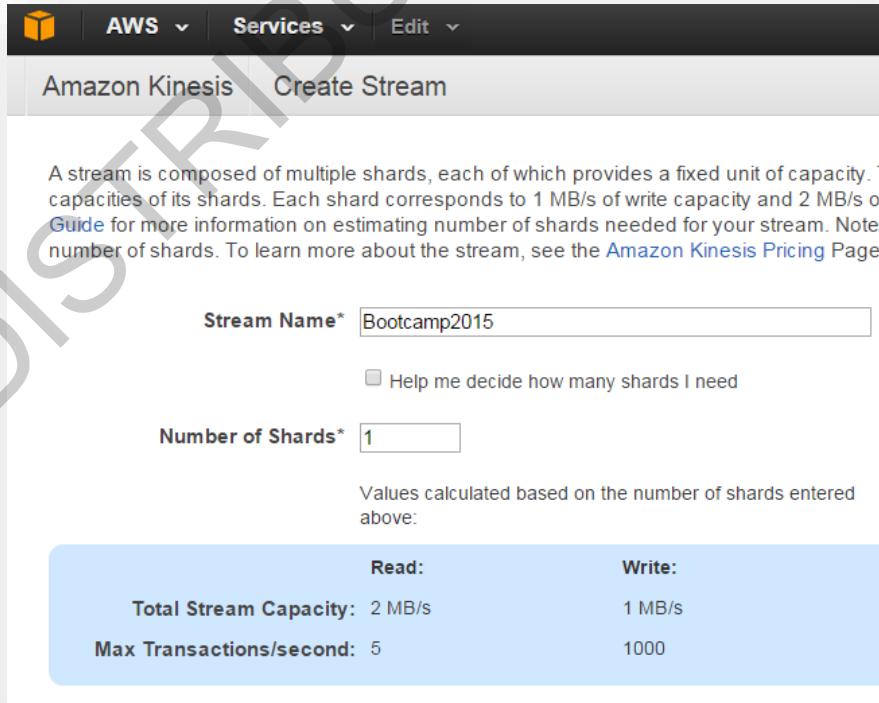

# How Amazon Kinesis relates to our appliance network

# Next Lab - Setting up a Kinesis stream

The Lab Guide will also update the IAM roles so that you can access Kinesis securely via Amazon Cognito

A stream is composed of multiple shards, each of which provides a fixed unit of capacity. To estimate the number of shards needed for your stream, see the [Amazon Kinesis Pricing Page](#). Each shard corresponds to 1 MB/s of write capacity and 2 MB/s of read capacity. For more information on estimating number of shards needed for your stream, see the [Amazon Kinesis Pricing Page](#).

Stream Name\*

Help me decide how many shards I need

Number of Shards\*

Values calculated based on the number of shards entered above:

Read:	Write:
Total Stream Capacity: 2 MB/s	1 MB/s
Max Transactions/second: 5	1000

# Lab 2: Creating a stream & updating IAM roles

## ■ Create stream

Use the console to create a stream with 1 shard

## ■ Create a new role for use later by AWS Lambda

We create the role manually and set managed policies

## ■ Use AWS CloudFormation to automate update of IAM roles

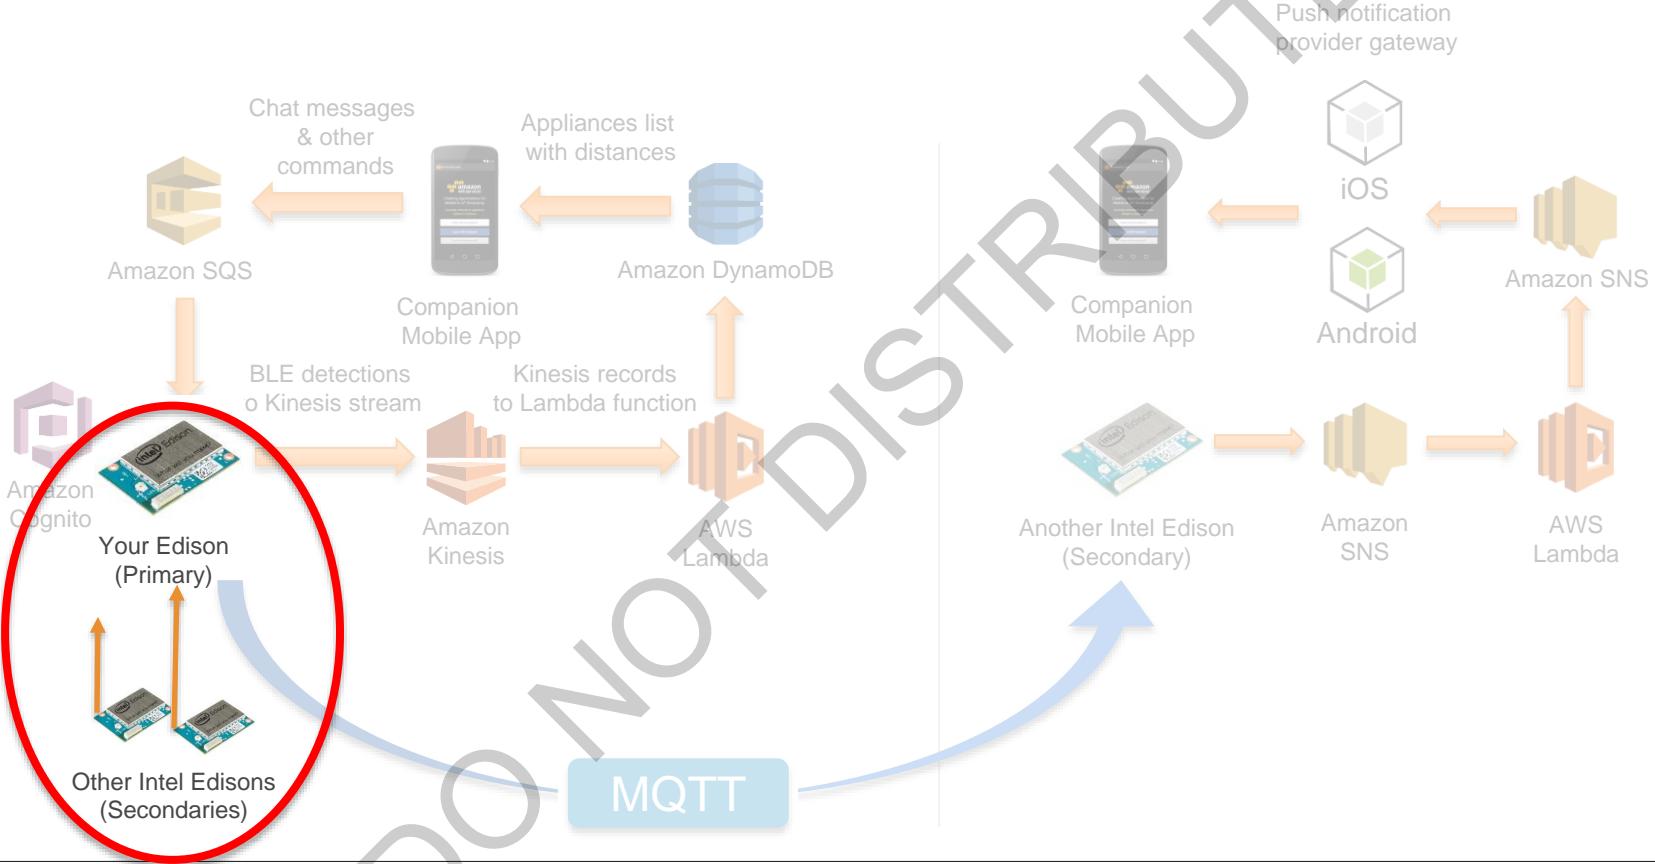

We demonstrate the use of AWS CloudFormation to automate setting all the policies and permissions we need for our Bootcamp

# LAB 2

Create Amazon Kinesis stream &  
set up all IAM policies for the  
Bootcamp using AWS CloudFormation

# Sign-posting

# Intel Edison

Setting up the Intel Edison

# developer kit

A fast, flexible and scalable path to commercial IoT Solutions

Come visit us at booth #1000 and #751 to see Intel's IoT solutions in action

# Recap: the Intel Edison

- Dual-core 500 MHz Atom CPU
- 4 GB storage
- 1GB RAM
- Yocto Linux
- WiFi 802.11 a/b/g/n
- Bluetooth 4.0

# Recap: the Intel Edison

All our 'appliance' code will run on the Intel Edison

Code is implemented in NodeJS

# Plugging in the hardware

Snap the Intel Edison SoC onto the breakout board

Line up the posts

*Be gentle!*

# Plugging in the hardware

This is the USB connector for SERIAL

Connect this to a spare  
USB slot on your laptop

# Plugging in the hardware

This is the USB connector for POWER

Connect this to another spare USB slot on your laptop

# Our next Lab: Setup Edison & Bootcamp configuration

## Set the name, root password & connect Edison to WiFi

Use the serial interface to gain first access to the device. Once you have connected to WiFi, you can use SSH to connect

## Download & Unpack the *Edison.tar* bundle

- The Edison.tar bundle contains several system and application files
- You move the files into the relevant locations
- Build/install Node Package dependencies
- You will edit the *bootcamp-config.js* file

# Our next Lab: Setup Edison & bootcamp configuration

## Initial config of the '**bootcamp-config.js**' file

The **bootcamp-config.js** file is the central configuration for your device and your entire domestic appliance system

You will set these values in this Lab

- **AWS Account Id** – from the Qwiklabs dashboard
- **Cognito Identity Pool Id** – you created this in Lab 1
- **Device Name** – give your device a name to recognize it from the list of all devices
- **Device Type** – you can choose to be a kettle, toaster, coffee machine and more!
- **Bluetooth BLE UUID** – the BLE ‘channel’. Make sure you use the same UUID as your partner
- **Mobile Push Provider** – either GCM for Android or APNS\_SANDBOX for iOS

# The *bootcamp-config.js* configuration file

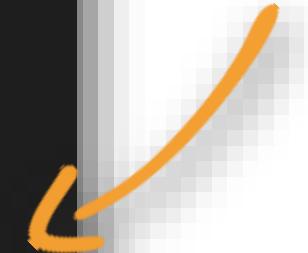

```
//////////  
//  
// Configure these values  
//  
//////////  
  
var DEVICE_NAME = "Mini Edison";  
var AWS_ACCOUNT_ID = "0000000000";  
var COGNITO_IDENTITY_POOL_ID = "us-east-1:XXXXXXXXXXXXXX";  
var MOBILE_ANALYTICS_APP_ID = "0000000000";  
var API_GATEWAY_ENDPOINT_URL = "https://REPLACE\_THIS\_WITH\_API\_GATEWAY\_URL\_FROM\_LAB\_GUIDE";  
var APPLIANCE_TYPE = 5;  
var BLE_UUID = "badf00d5dffb48d2b060d0f5a71096e0";  
var GOOGLE_PROJECT_NUMBER = "0000000000";  
var MOBILE_PUSH_PROVIDER = "GCM"; // Set to GCM for Android or APNS for iOS mobile push
```

*Path on your Intel Edison* /etc/bootcamp-config.js

# Appliance definitions

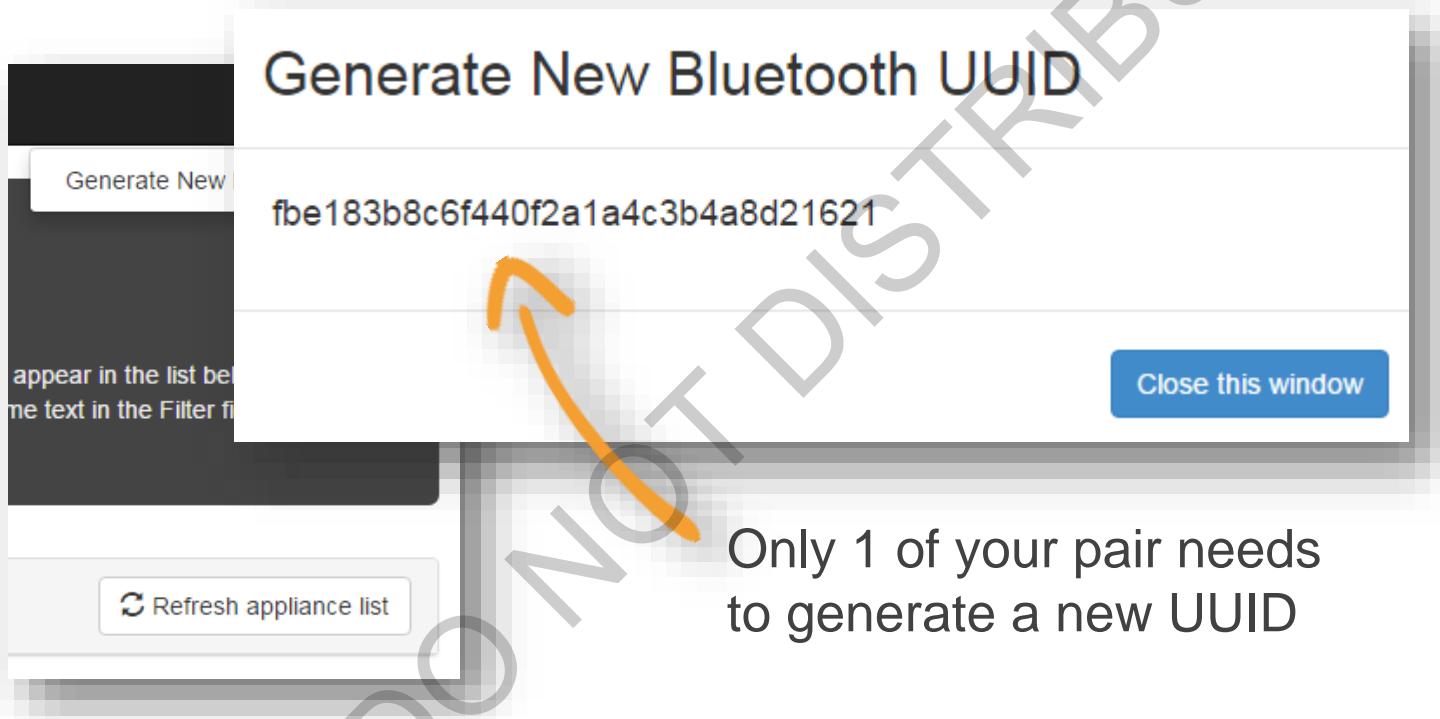

```
//

and use **vi** as a text editor

# LAB 3

Configure your Intel Edison  
to run our system

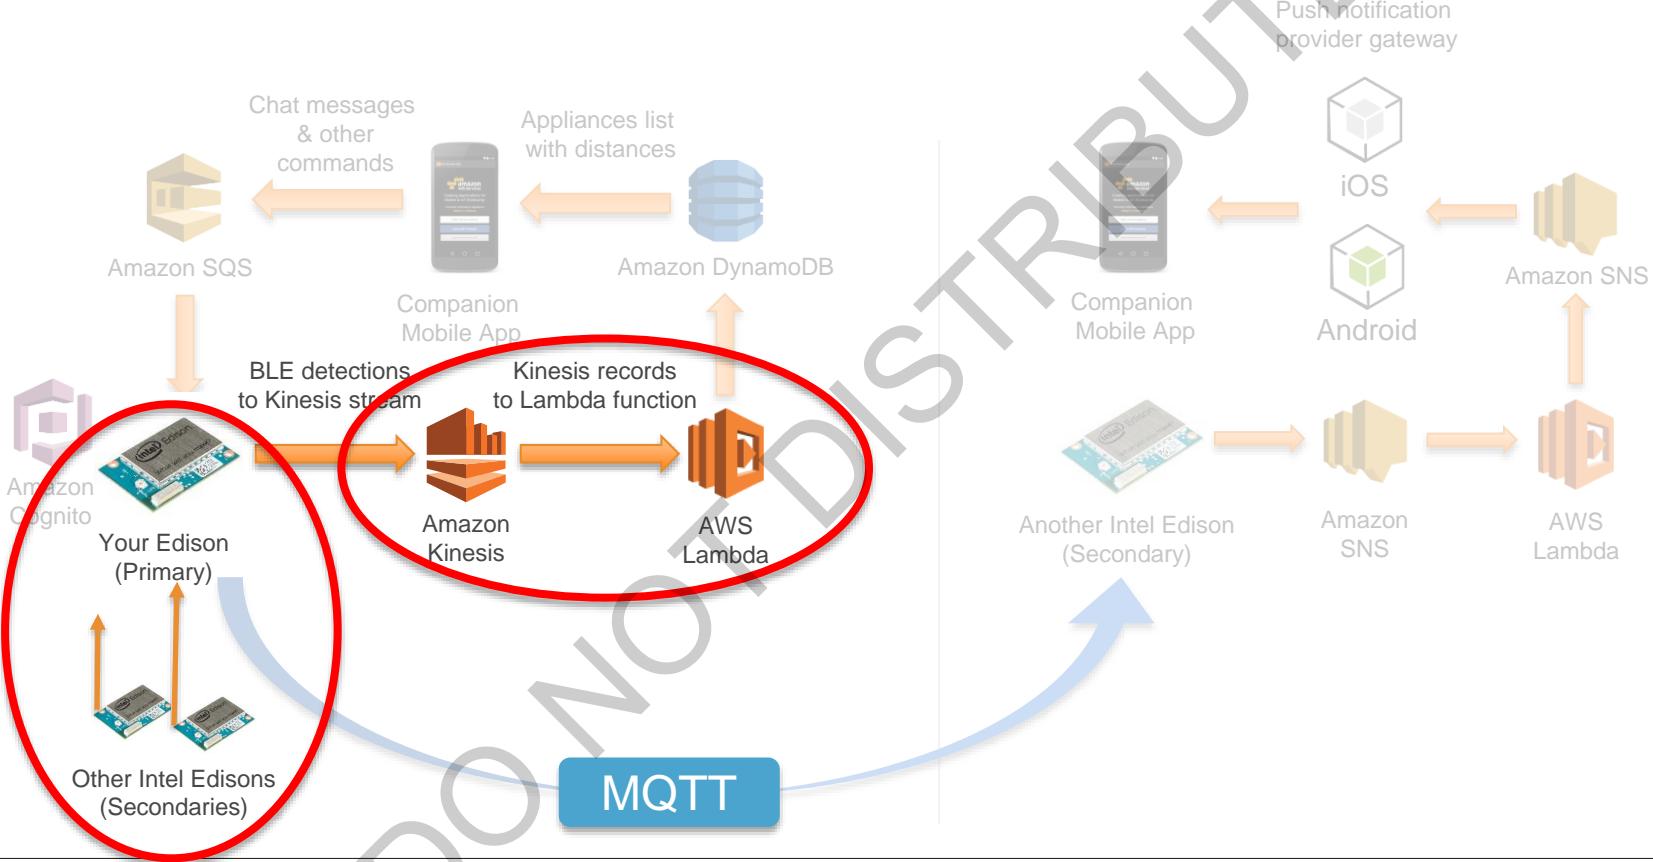

# Part 2

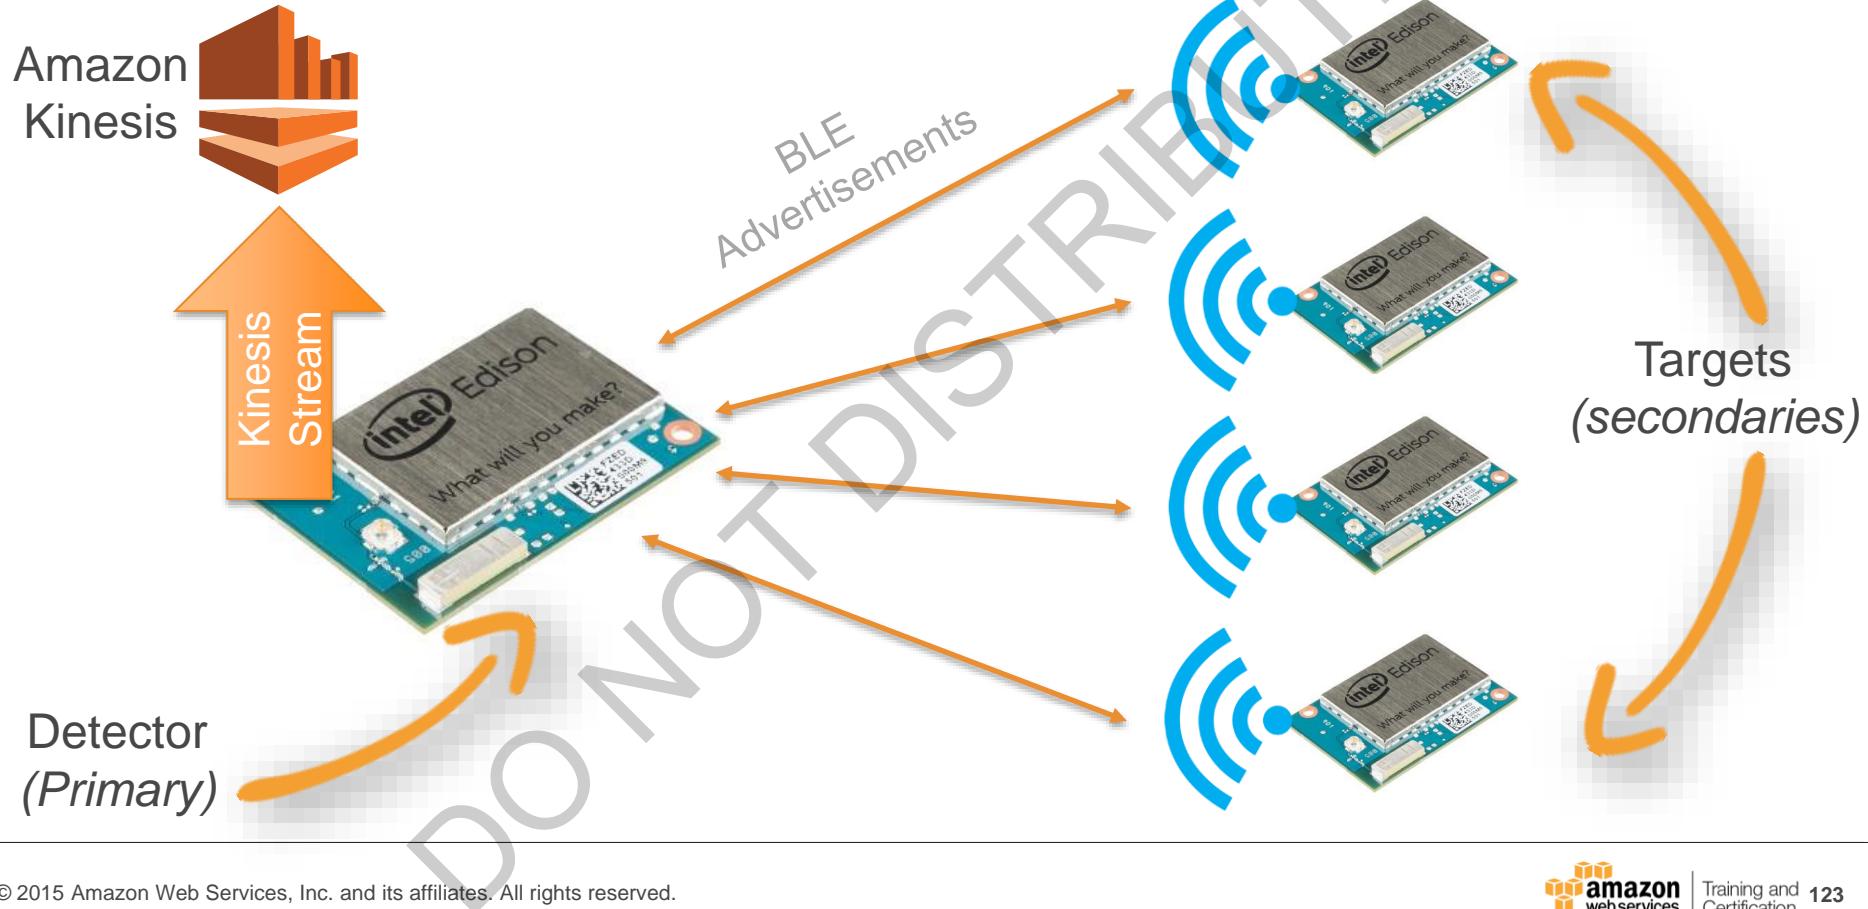

Detecting appliances in range  
using Bluetooth Low Energy,  
Amazon Kinesis & AWS Lambda

# Sign-posting

# Detecting peers using Bluetooth LE

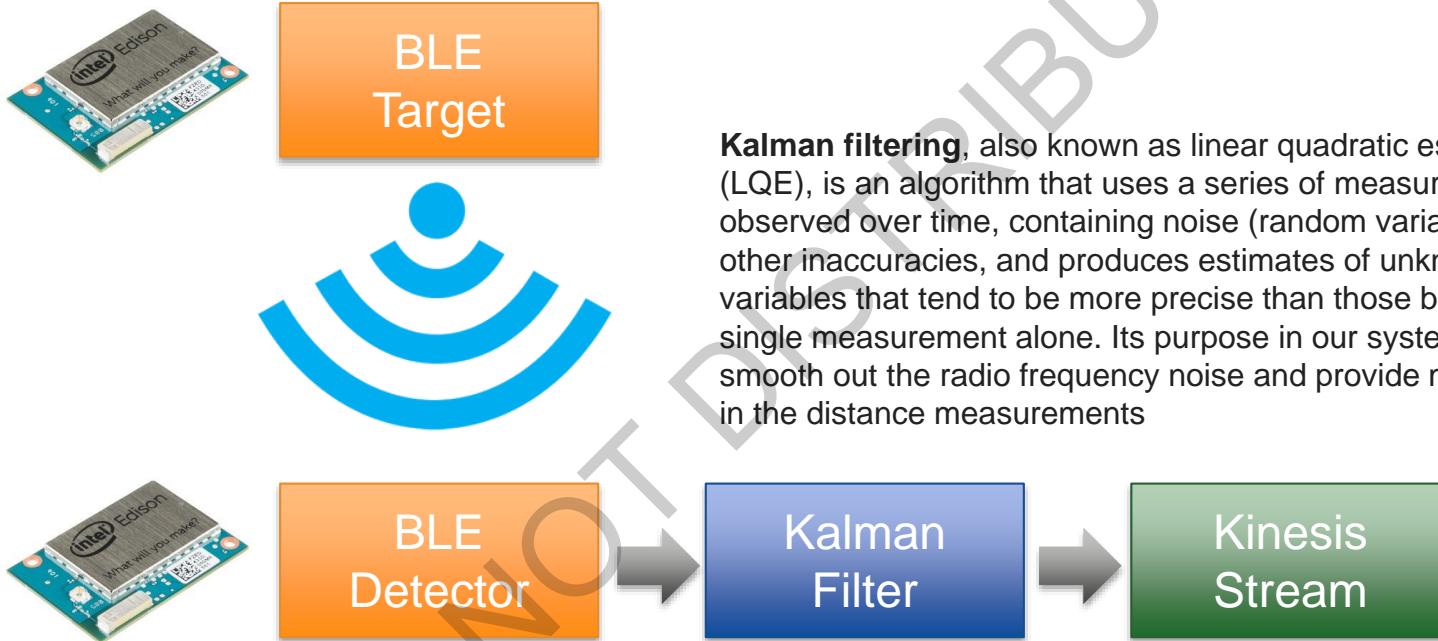

# Bluetooth Low Energy

- Light-weight subset of classic Bluetooth
- Part of the Bluetooth 4.0 specification
- Advertisement packets sent at ~1Hz
- Technology behind iBeacon by Apple
- Key fields in advertisement
  - UUID – the ‘channel’ the device belongs to. A group of related devices.
  - RSSI – received signal strength indicator – measurement of the strength of the signal being received

*iBeacon spec also has MAJOR & MINOR – 2-byte integers that can be used to identify an individual device in a group of related devices*

# Bluetooth Low Energy - RSSI

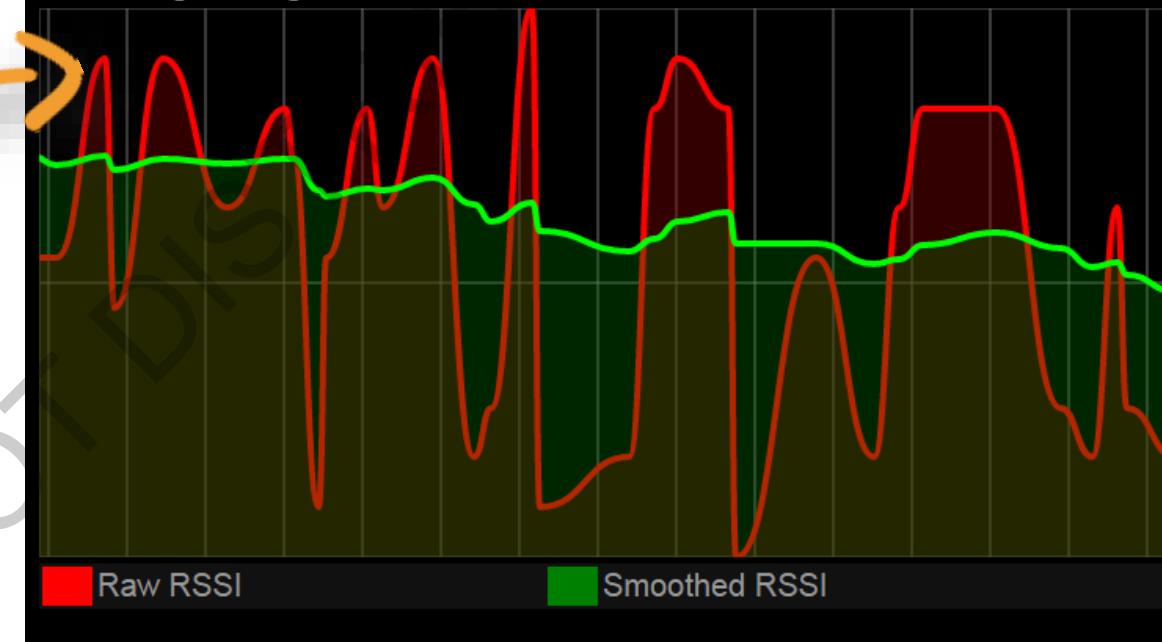

**Kalman filtering**, also known as linear quadratic estimation (LQE), is an algorithm that uses a series of measurements observed over time, containing noise (random variations) and other inaccuracies, and produces estimates of unknown variables that tend to be more precise than those based on a single measurement alone. Its purpose in our system is to smooth out the radio frequency noise and provide more accuracy in the distance measurements

# Bluetooth Low Energy

The red line is the 'raw' RSSI of the Bluetooth Low Energy advertisements as received by the Edison

## Realtime BLE Detection

Received Signal Strength

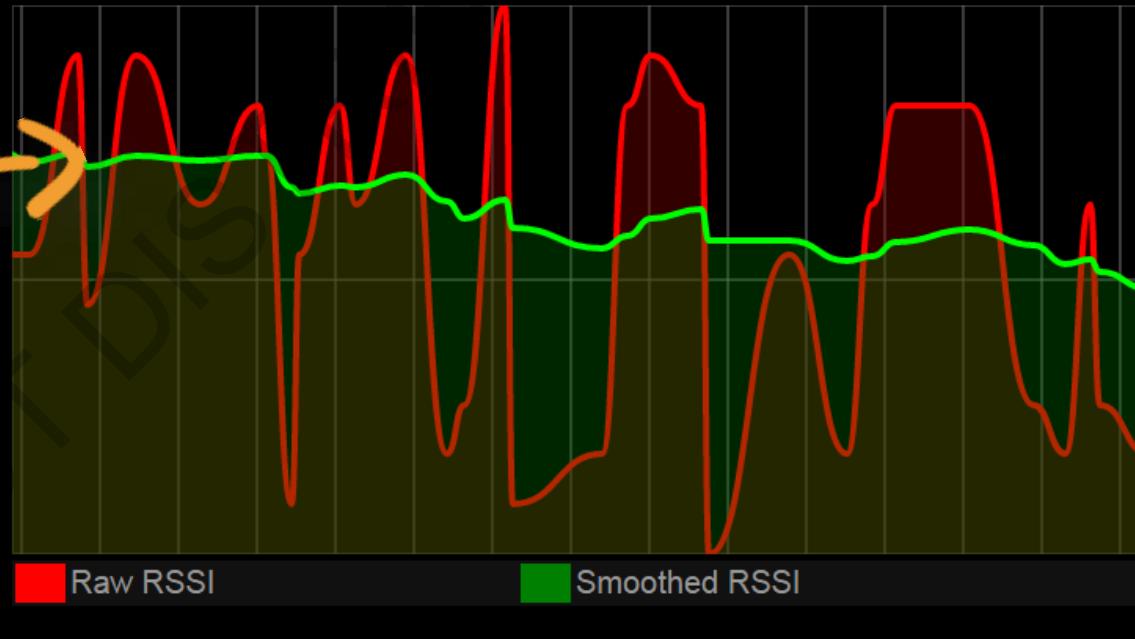

# Bluetooth Low Energy

The green line is the same data run through the Kalman filter and then sent to Amazon Kinesis.

'Noise' in the signal has been minimized

## Realtime BLE Detection

Received Signal Strength

# Bluetooth Low Energy

```
{  
    name          : "192.168.200.13:6",  
    uuid          : "984fee033fbc",  
    rssi          : -57,  
    confidence    : 36.37,  
    filteredRSSI  : -53.8195,  
    calculatedDistance : 0.3989,  
    lastDetectionTimestamp : "2015-05-23T03:45:07.417Z"  
}
```

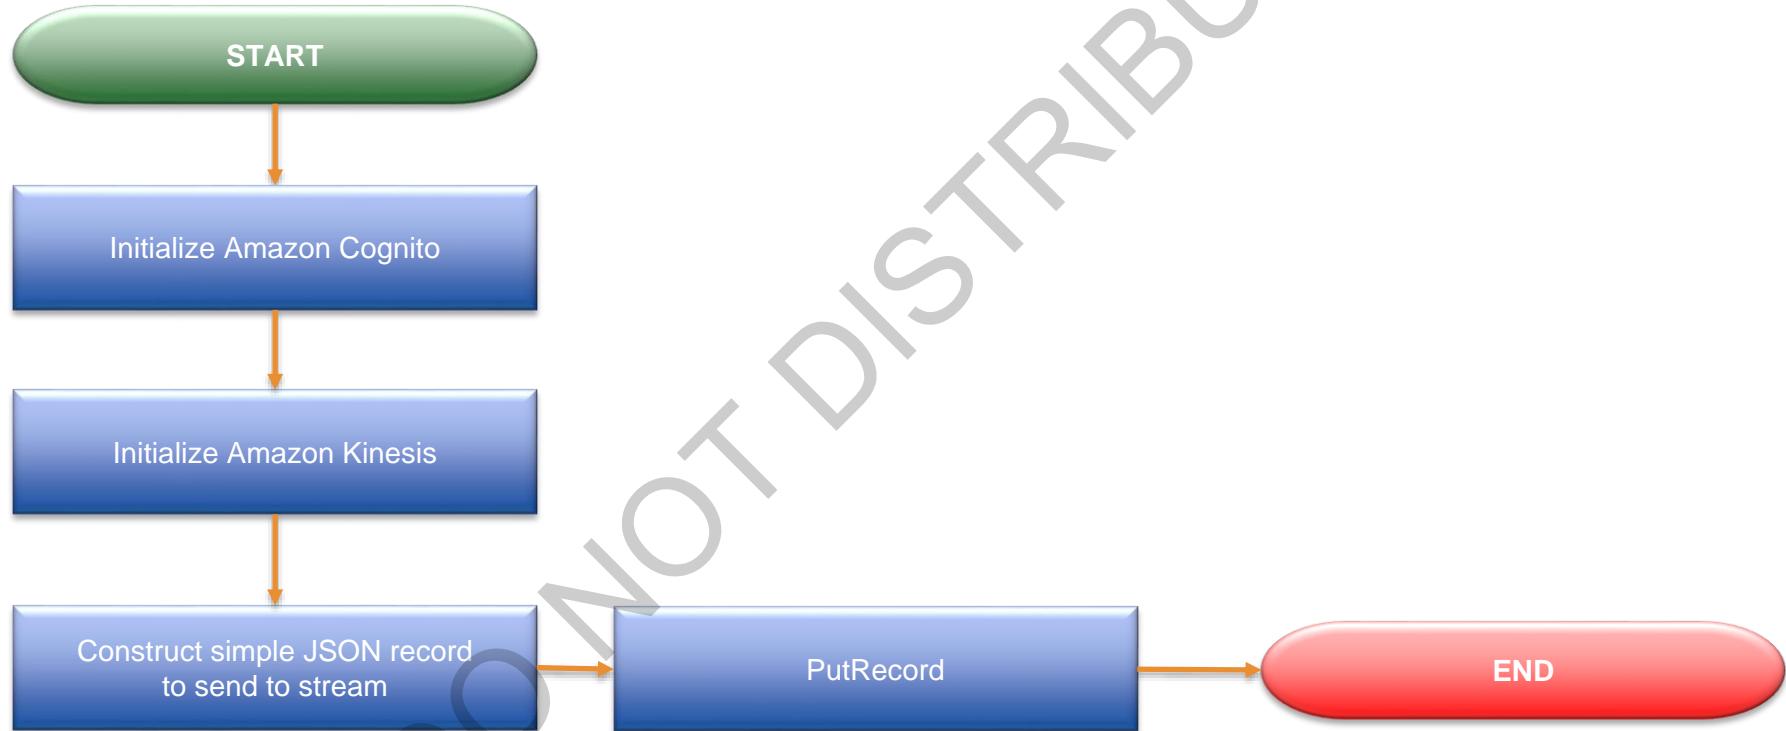

Raw Received Signal Strength as detected

# Bluetooth Low Energy

```
{  
    name : "192.168.200.13:6",  
    uuid : "984fee033fbc",  
    rssi : -57,  
    confidence : 36.37,  
    filteredRSSI : -53.8195, // Calculated RSSI after Kalman filtering  
    calculatedDistance : 0.3989,  
    lastDetectionTimestamp : "2015-05-23T03:45:07.417Z"  
}
```

Calculated RSSI after Kalman filtering

# Sending a test record to Amazon Kinesis from NodeJS

# Sending a record to Amazon Kinesis from NodeJS

```
function initialiseCognito()
{
    console.log("Initialising Cognito...");

    var params = {
        AccountId: configuration.aws.AWS_ACCOUNT_ID,
        RoleArn: configuration.aws.COGNITO_ROLE_UNAUTH,
        IdentityPoolId: configuration.aws.COGNITO_IDENTITY_POOL_ID
    };

    // initialize the region for the SDK
    aws.config.region = configuration.aws.COGNITO_REGION;

    // initialize the Credentials object
    aws.config.credentials = new aws.CognitoIdentityCredentials(params);

    // Get the credentials for our user
    aws.config.credentials.get(function(err)
    {
        if (err)
        {
            console.log("## credentials.get: " + err, err.stack); // an error occurred
        }
        else
        {
            console.log("Cognito IdentityId => " + aws.config.credentials.identityId);
        }
    });
}
```

Initialize Amazon Cognito

# Sending a record to Amazon Kinesis from NodeJS

```
function sendRecordToKinesis()
{
    var partitionKey      = aws.config.credentials.identityId;
    var recordParams     =
    {
        Data:          "Hello Kinesis World!",
        PartitionKey: partitionKey,
        StreamName:   configuration.aws.KINESIS_STREAM
    };
    console.log(JSON.stringify(recordParams));
    kinesis.putRecord(recordParams, onKinesisPutRecord);
}
```

Construct simple record  
& send to stream

# Node Libraries for BLE

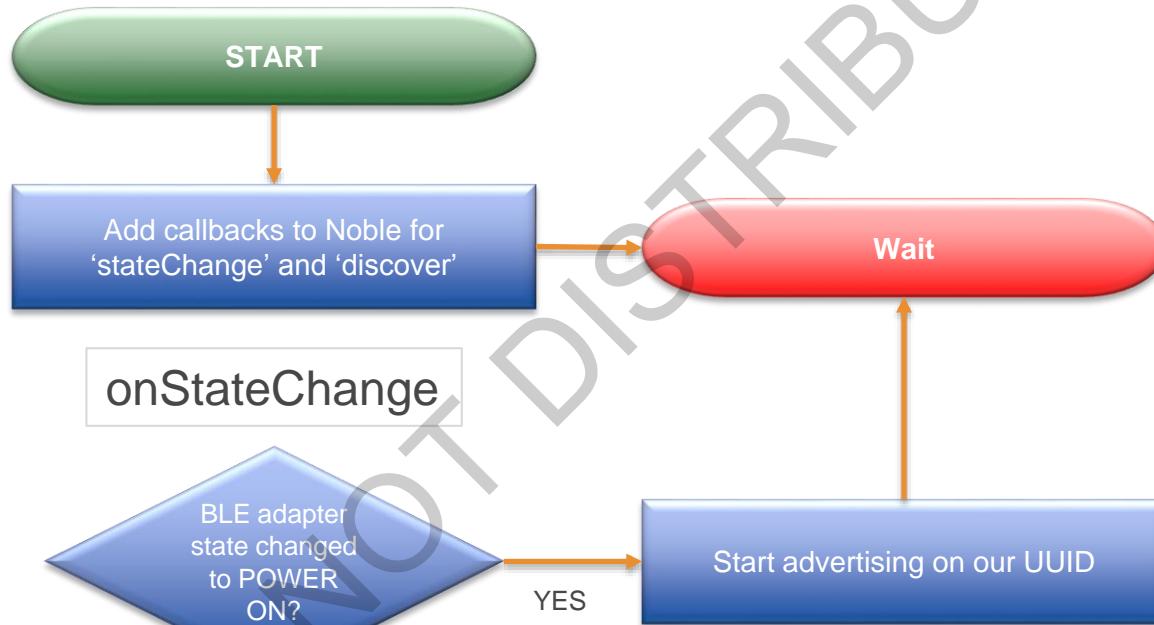

## Bleno

- A node.js module for implementing BLE (Bluetooth low energy) peripherals
- Allows us to easily advertise our appliance using BLE
- Acts as a ‘server’ (Bluetooth peripheral)

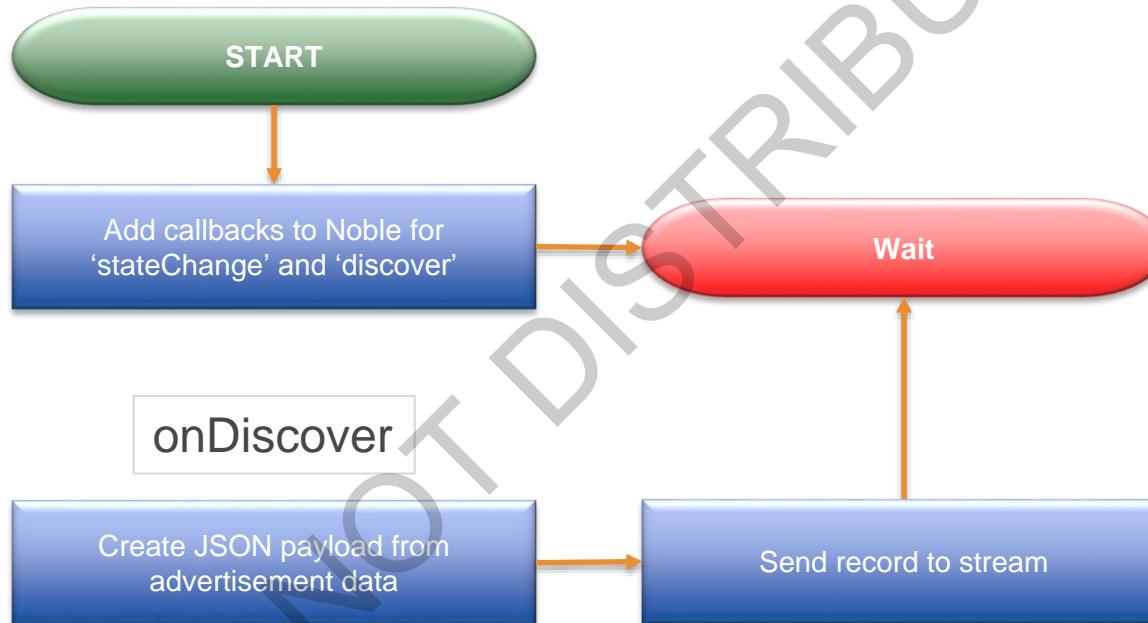

## Noble

- A node.js BLE central module
- Allows us to easily detect other devices in range using BLE
- Callbacks for state change in the Bluetooth adapter and when a new appliance (Bluetooth peripheral) is detected

# How we ‘wire up’ BLE using Bleno and Noble in NodeJS

# How we ‘wire up’ BLE using Bleno and Noble in NodeJS

# main() – wire up callbacks

```
function main()
{
    noble.on('stateChange', onNobleStateChange);
    noble.on('discover',    onNobleDiscoverPeripheral);
    noble.on('warning',    onNobleWarning);

    setInterval(reportKinesisInFlight, 1000);
}
```

# onNobleStateChange() – start advertising

```
function onNobleStateChange(state)
{
    console.log("onNobleStateChange -> " + state);

    if ( state == "poweredOn" )
    {
        console.log("Starting to Advertise this Edison...");
        bleno.startAdvertising( getApplianceName(), configuration.bluetooth.ble.uuid);

        console.log("Initialising Cognito...");
        initialiseCognito();
    }
    else
    {
        console.log("onNobleStateChange -> " + state);
    }
}
```

# onNobleDiscoverPeripheral() – send record to stream

```
function onNobleDiscoverPeripheral(peripheral)
{
    var objPayload = new bleadv(new Date(), peripheral.uuid, peripheral.advertisement.localName, peripheral.rssi);
    var strPayload = JSON.stringify(objPayload);
    console.log(peripheral.advertisement.localName + " [" + peripheral.uuid + "] @ " + peripheral.rssi + " dBm");
    sendRecordToKinesis(strPayload);
}
```

# Lab 4 – console output

# LAB 4

Write BLE detection data  
to Amazon Kinesis Stream – ‘raw’ mode  
& ‘smoothed and batched’ mode

# Sign-posting

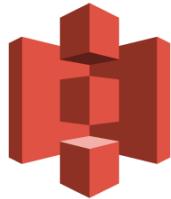

# AWS Lambda

Zero-administration compute

# AWS Lambda

## is connective tissue for AWS services

Amazon S3

Amazon DynamoDB

Amazon SNS

Amazon Kinesis

Amazon Cognito

# AWS Lambda

## ■ Zero-administration

Focus on business logic, not infrastructure.

Just upload your code & Amazon Lambda handles the rest

## ■ Auto-scaling

AWS Lambda scales the infrastructure as needed to match the event rate and pay as you go

## ■ Bring your own Code

Node.JS & Java 8 available now with other languages to follow.  
Create threads and processes, run batch scripts **or other exe's**

# AWS Lambda

## Sync & Async events

Respond to application calls with low-latency real-time functions

## Trigger Lambda Functions Using Amazon SNS

Respond dynamically and automatically to SNS notifications

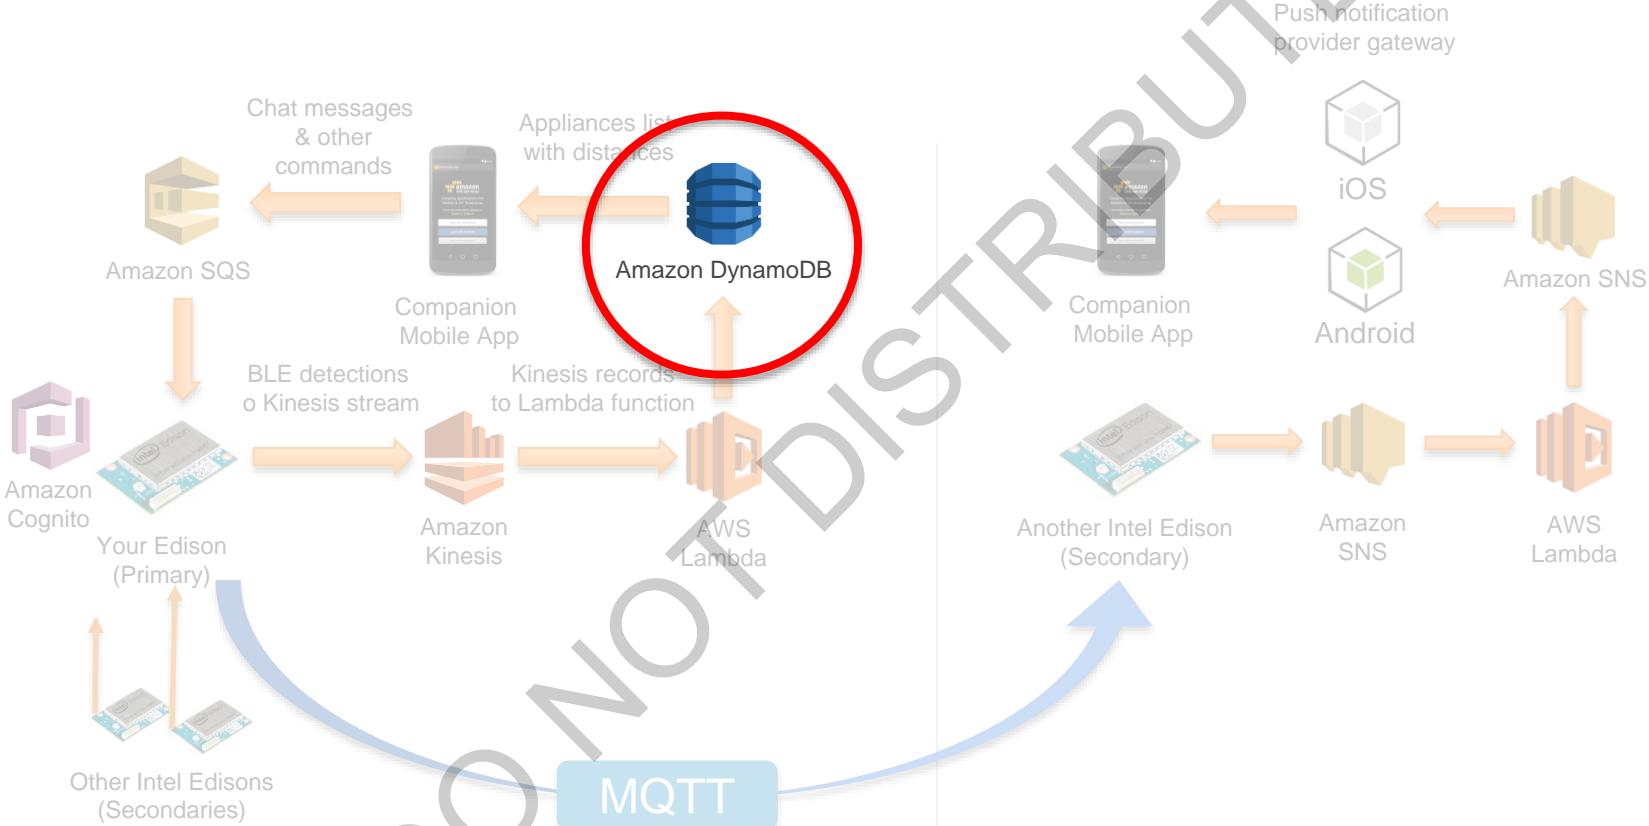

## Multiple AWS Lambda Functions for Amazon Kinesis Streams

Attach one or more Lambda functions to handle stream events

## Integrate AWS Lambda with Amazon Cognito

Intercept changes to datasets with **Cognito Sync Triggers**, or trigger code to run by subscribing to changes in datasets with **Cognito Streams**

# Sign-posting

# Amazon DynamoDB

Fully managed NoSQL database service  
with fast and predictable performance

# Amazon DynamoDB: Managed NoSQL in the Cloud

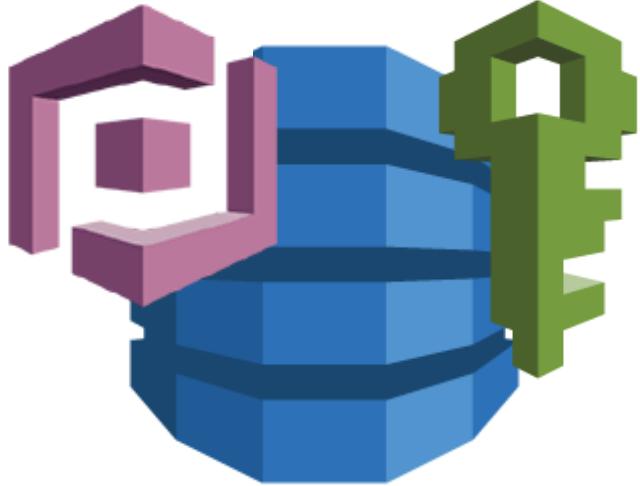

*Non-Relational Managed  
NoSQL Database Service*

- Schema-less data model
- Consistent **low-latency** performance
- Predictable provisioned throughput
- Seamless **scalability**
- No storage limits
- High-durability and **availability**
- Easy Administration – **We scale for you!**
- **Low Cost**
- Cost modeling on **throughput and size**

# Amazon DynamoDB: Managed NoSQL in the Cloud

Amazon Cognito

AWS IAM

*Non-Relational Managed  
NoSQL Database Service*

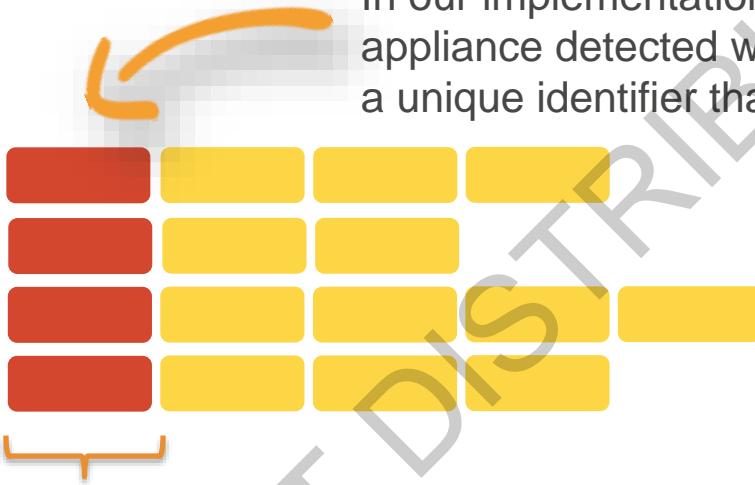

- Fully integrated with AWS Identity & Access Management
  - Security is native to Amazon DynamoDB
  - Implement Fine-grained access control of individual records – even which fields of records can be accessed
  - For example, make use of the **Cognito Identity** for a user as a key in Amazon DynamoDB to create partitioned views and control access to records based on this key

# Amazon DynamoDB is a schemaless database

# Amazon DynamoDB – Hash Key

In our implementation, each row represents an appliance detected within range and is identified by a unique identifier that we use as the Hash Key

Hash key  
(Amazon DynamoDB maintains  
an unordered index)

# LAB 5

Using AWS Lambda to write  
Amazon Kinesis records to  
Amazon DynamoDB

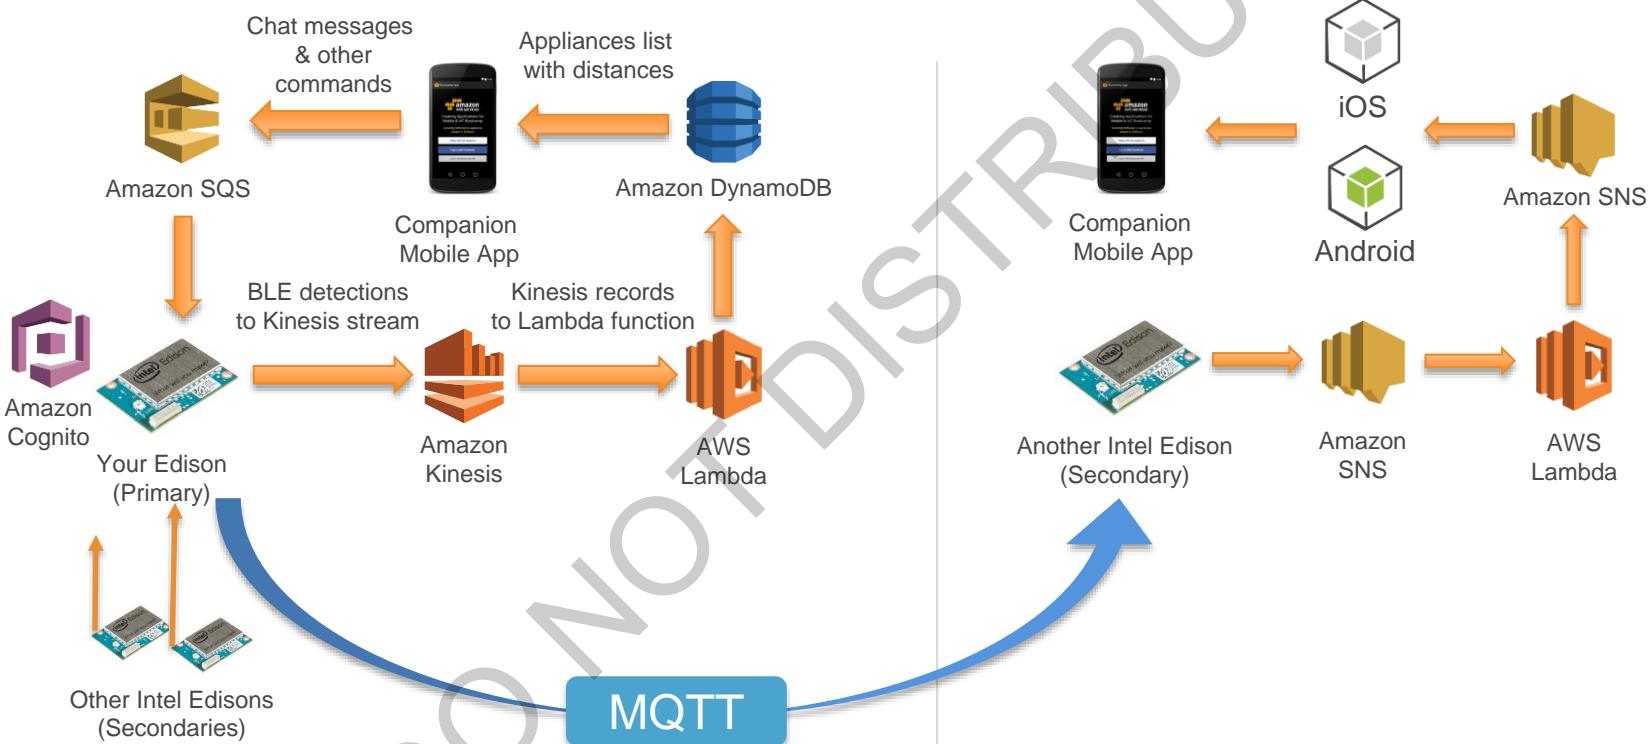

# Part 3

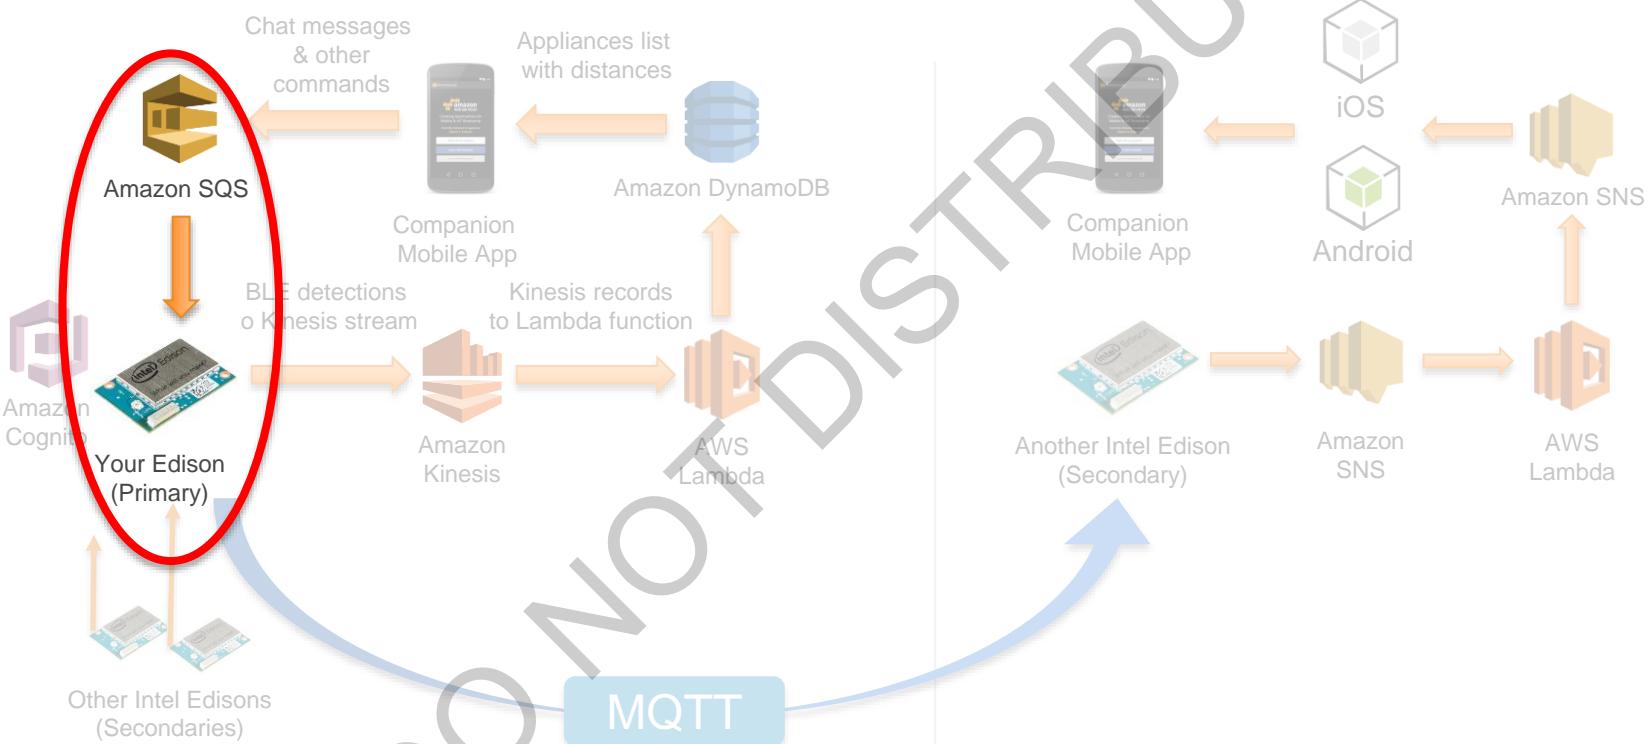

Commanding the IoT device:  
messaging with Amazon SQS,  
Amazon SNS & the MQTT protocol

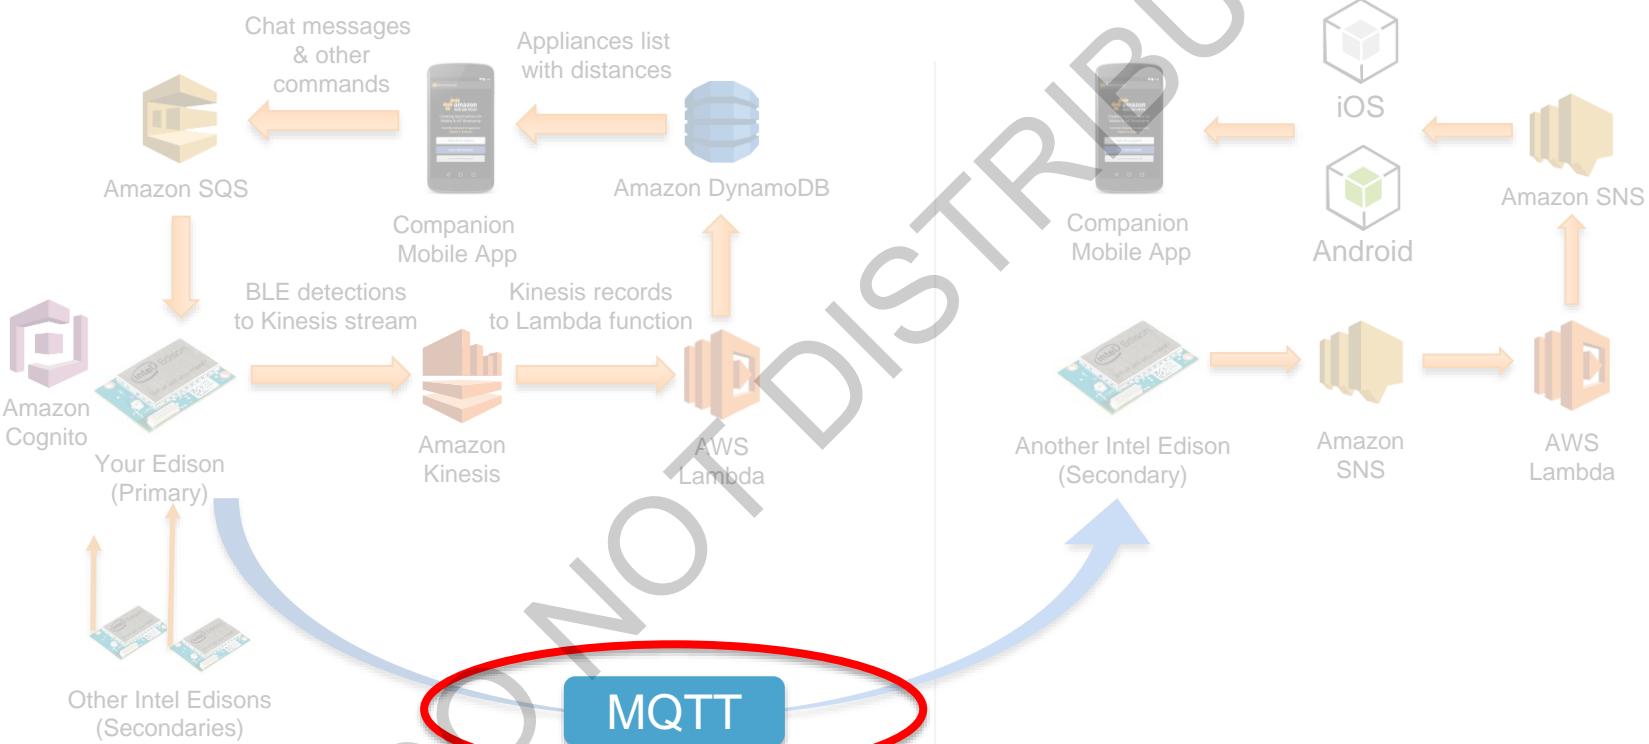

# System architecture

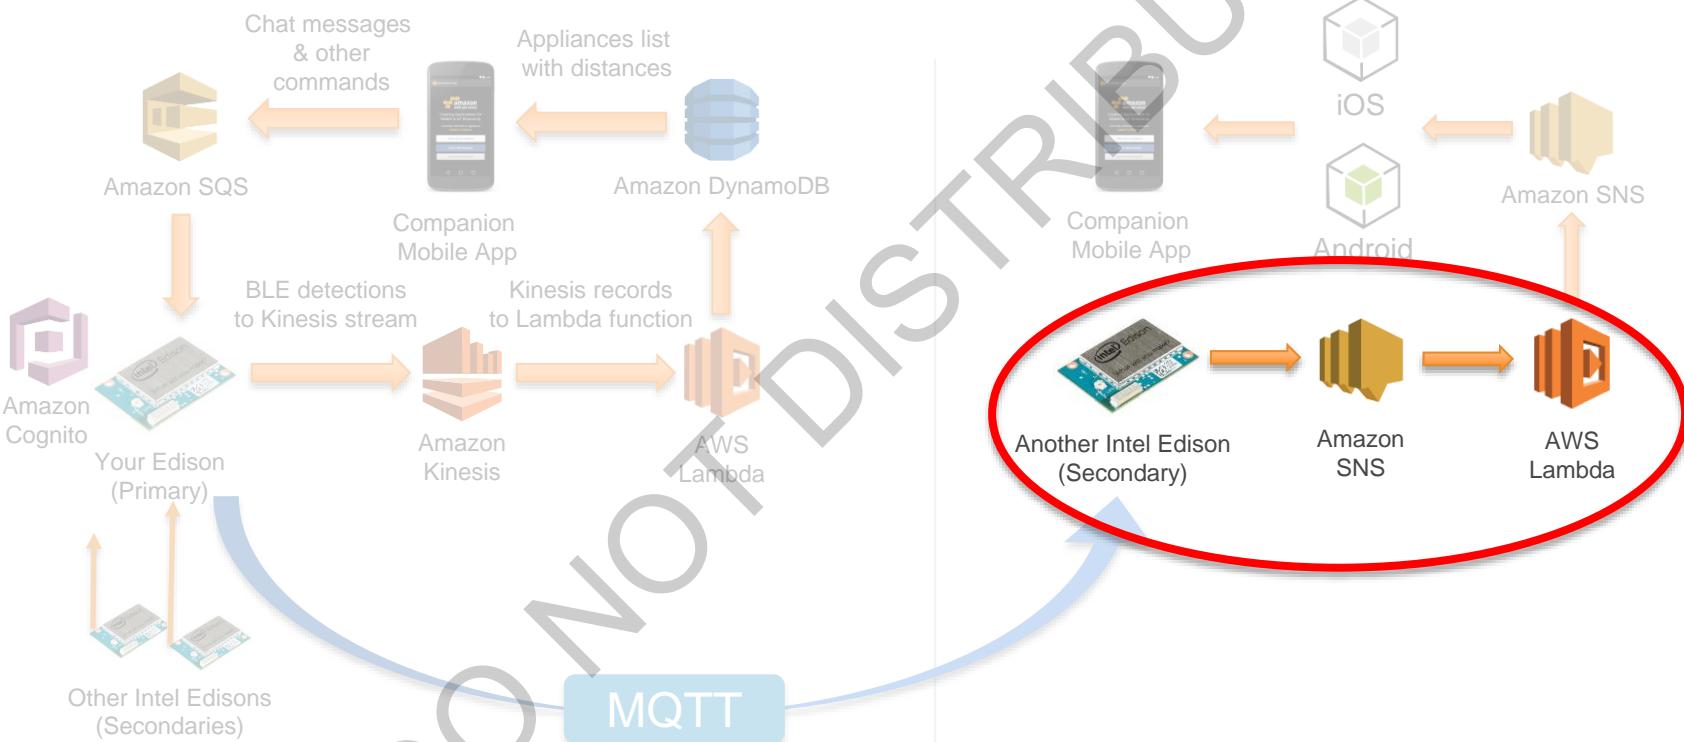

# System architecture

# System architecture

# System architecture

# Amazon SQS

Fast, reliable, scalable, fully managed  
message queuing service

# Amazon SQS

## ■ Reliable

Messages stored redundantly across servers and data centers

## ■ Scalable

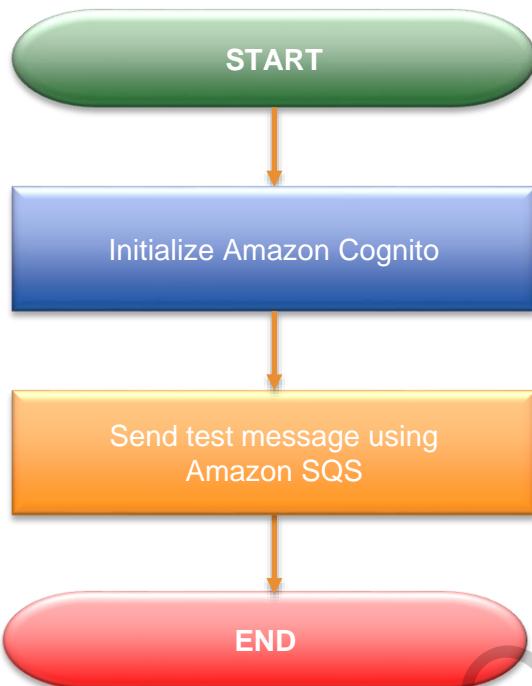

Designed to enable an unlimited number of messaging services  
read and write an unlimited number of messages at any time

## ■ Simple and inexpensive

Only 5 API calls to manage queues and send/receive messages.  
No up-front costs – just pay for what you use

# Lab 6: How we use Amazon SQS – sending a message

test-send-sqs-message.js

```
function sendSQSMessage()
{
    console.log("Sending message to SQS queue...");
    sqs = new aws.SQS();

    var messageToSend = new compak(compak.COMMAND_TEST, "Hello, World!");

    sqs.sendMessage({
        QueueUrl: configuration.aws.SQS_URL_QUEUE_TO_EDISON,
        MessageBody: JSON.stringify(messageToSend)
    }, onSQSMessageSent );

    console.log("      sent");
}
```

# Lab 6: How we use Amazon SQS – receiving a message

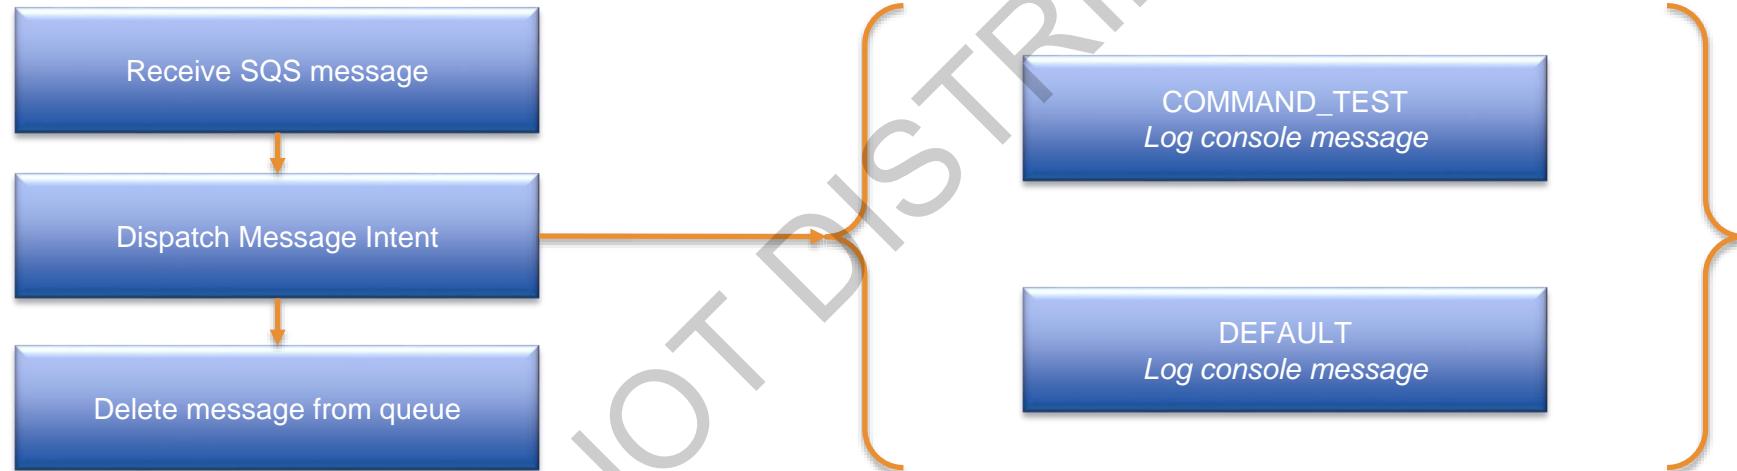

test-receive-sqs-message.js

# Lab 6: How we use Amazon SQS – receiving a message

*test-receive-sqs-message.js*

onSQSMessageReceived

# Lab 6: How we use Amazon SQS – receiving a message

test-receive-sqs-message.js

```
function thread_ListenToSQSQueue()
{
    sqs.receiveMessage({
        QueueUrl: configuration.aws.SQS_URL_QUEUE_TO_EDISON,
        MaxNumberOfMessages: 1,
        VisibilityTimeout: 60,
        WaitTimeSeconds: 2
    }, onSQSMessageReceiveReturned);
}
```

Maximum time this 'long poll' will wait before returning without any messages. Will return earlier if any messages arrive during the wait time

# Lab 6: How we use Amazon SQS – receiving a message

test-receive-sqs-message.js

```
function thread_ListenToSQSQueue()
{
    sqs.receiveMessage({
        QueueUrl: configuration.aws.SQS_URL_QUEUE_TO_EDISON,
        MaxNumberOfMessages: 1,
        VisibilityTimeout: 60,
        WaitTimeSeconds: 2
    }, onSQSMessageReceiveReturned );
}
```

Maximum time a message will be ‘in flight’ before it is returned to the message queue for processing

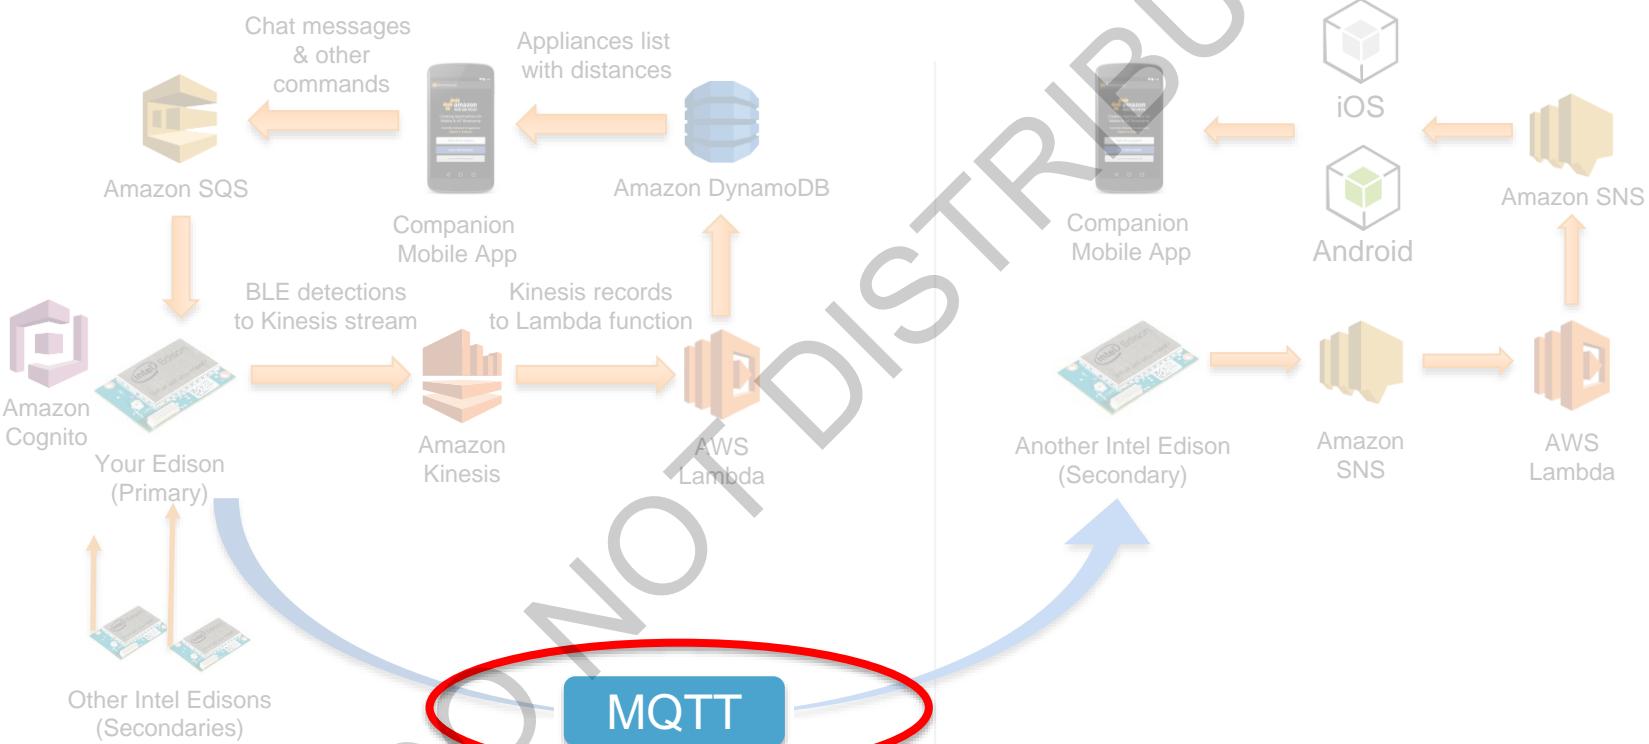

# Lab 6: How we use Amazon SQS – receiving a message

test-receive-sqs-message.js

```
function onSQSMessageReceiveReturned(err, data)
{
    if (err)
    {
        console.log("ERROR: onSQSMessageReceiveReturned() -> " + err);
    }
    else
        // If there are any messages to get
        if (data.Messages)
        {
            //
            // Process the message
            //
            DispatchQueueMessage(data.Messages);
        }

        setTimeout(thread_ListenToSQSQueue, 1000);
}
```

# System architecture

# What is MQTT?

- “MQ Telemetry Transport”

Designed for message exchange between constrained devices and low-bandwidth, high-latency or unreliable networks

- Simple & Lightweight

Uses TCP, long-lived connection to an MQTT broker. A broker is built in to the base Yocto image on Edison  
(RSMB - the *Really Simply Message Broker*)

- Publish/Subscribe model

Simply subscribe to a topic and publish messages.

Many-to-many protocol.

Delivery modes: Fire & Forget; At least Once; Only Once

# Using NodeJS libraries for MQTT

## mqtt

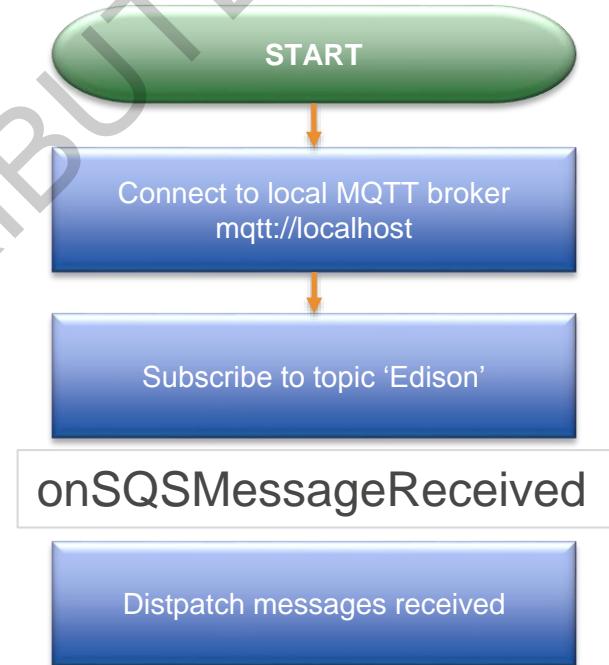

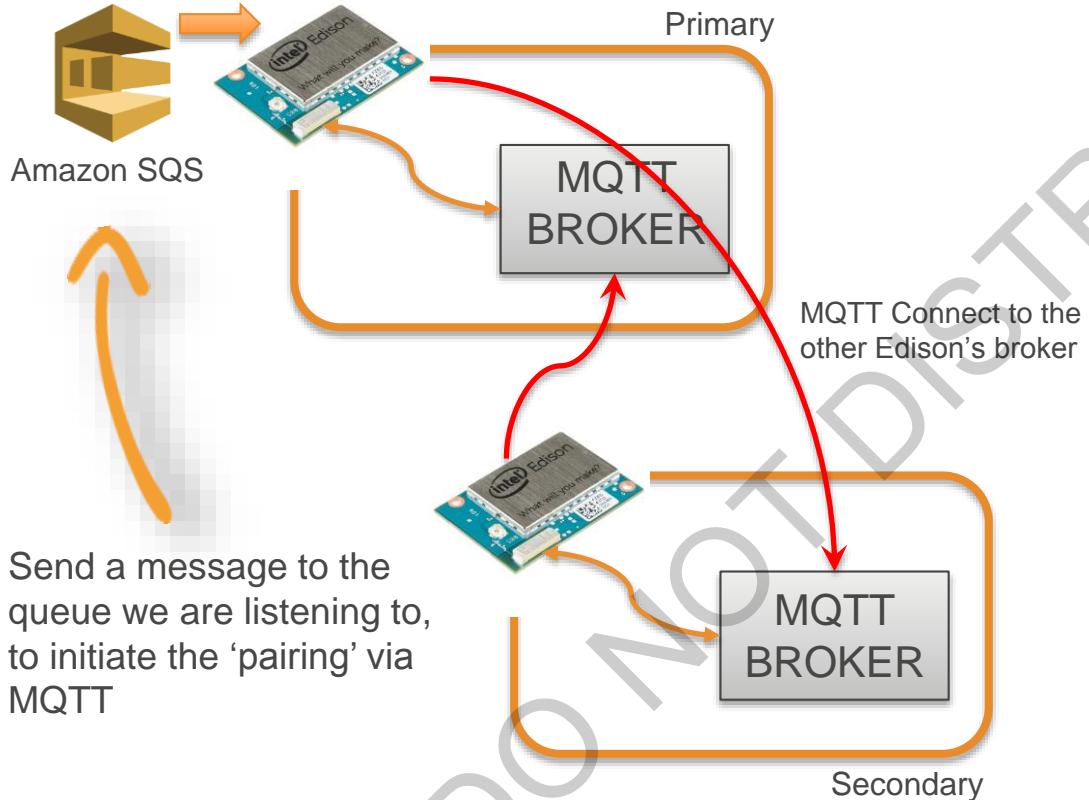

- A node.js module for implementing MQTT
- Simple to use
- Async, callback-based

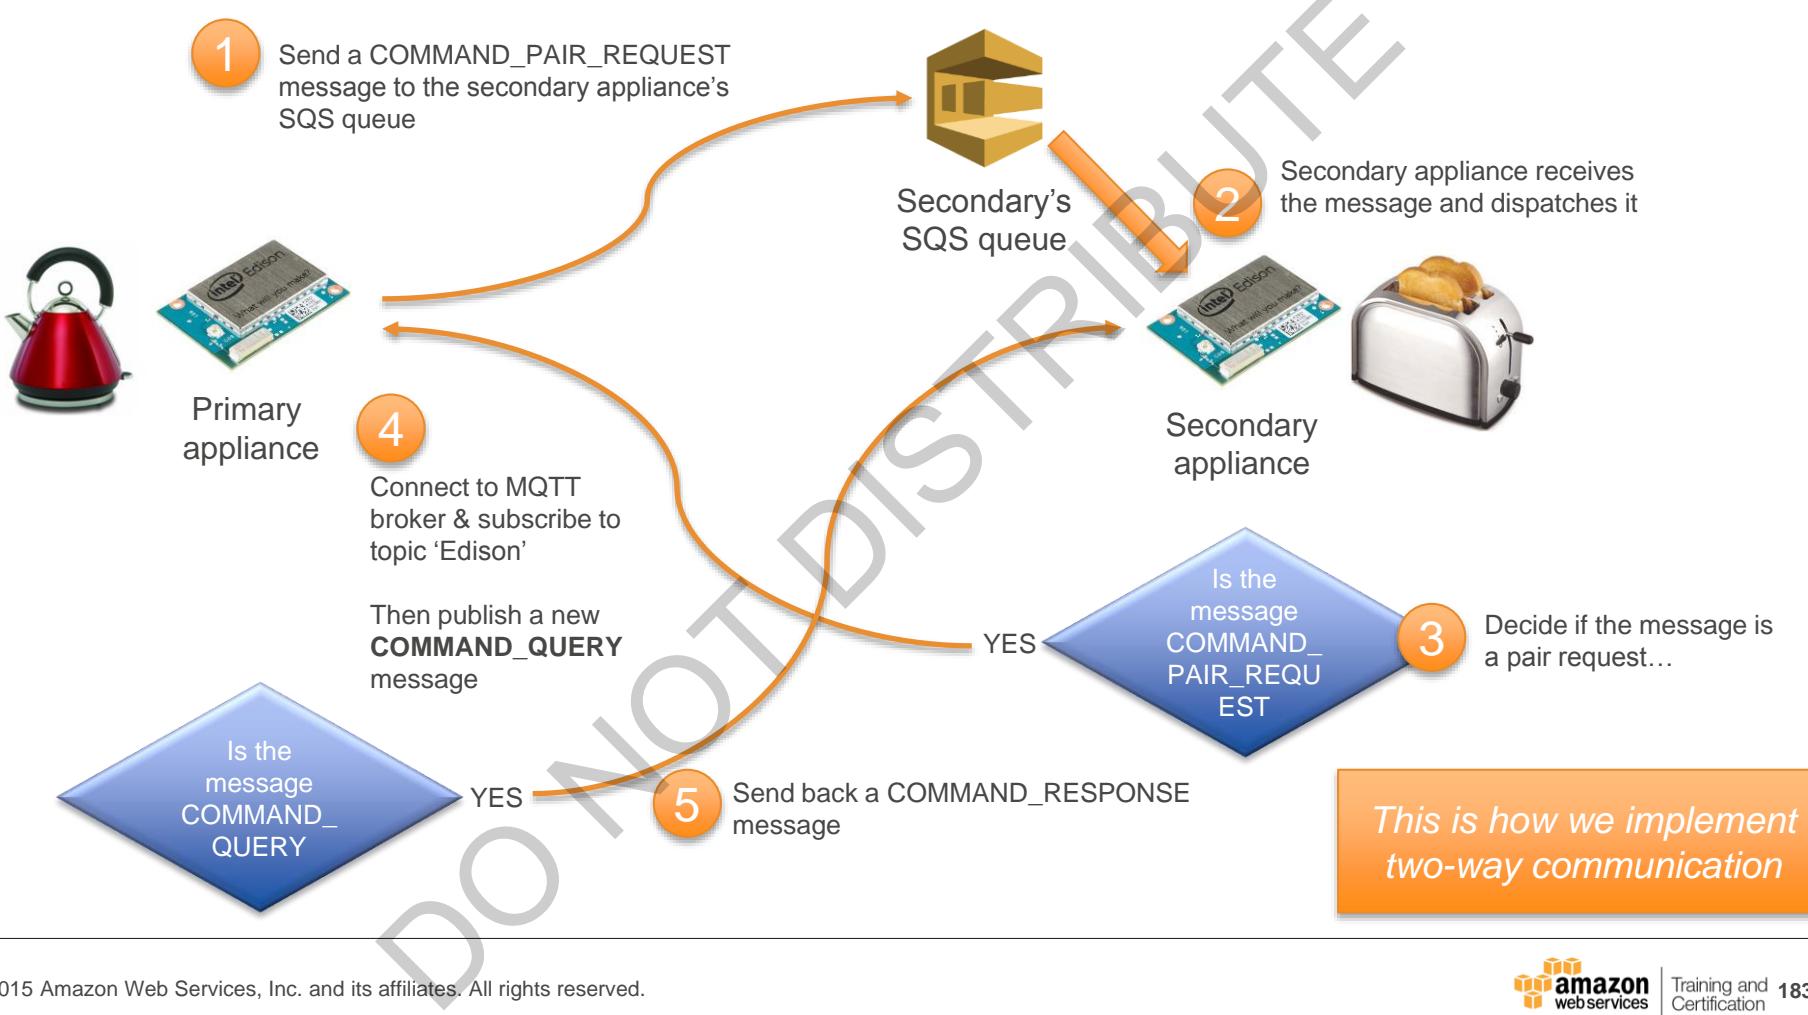

```
var mqtt = require('mqtt');  
var mqttClient = mqtt.connect('mqtt://localhost');
```

Note that we listen to our local MQTT broker  
for in-bound connections to our appliance  
rather than using a central, shared MQTT broker

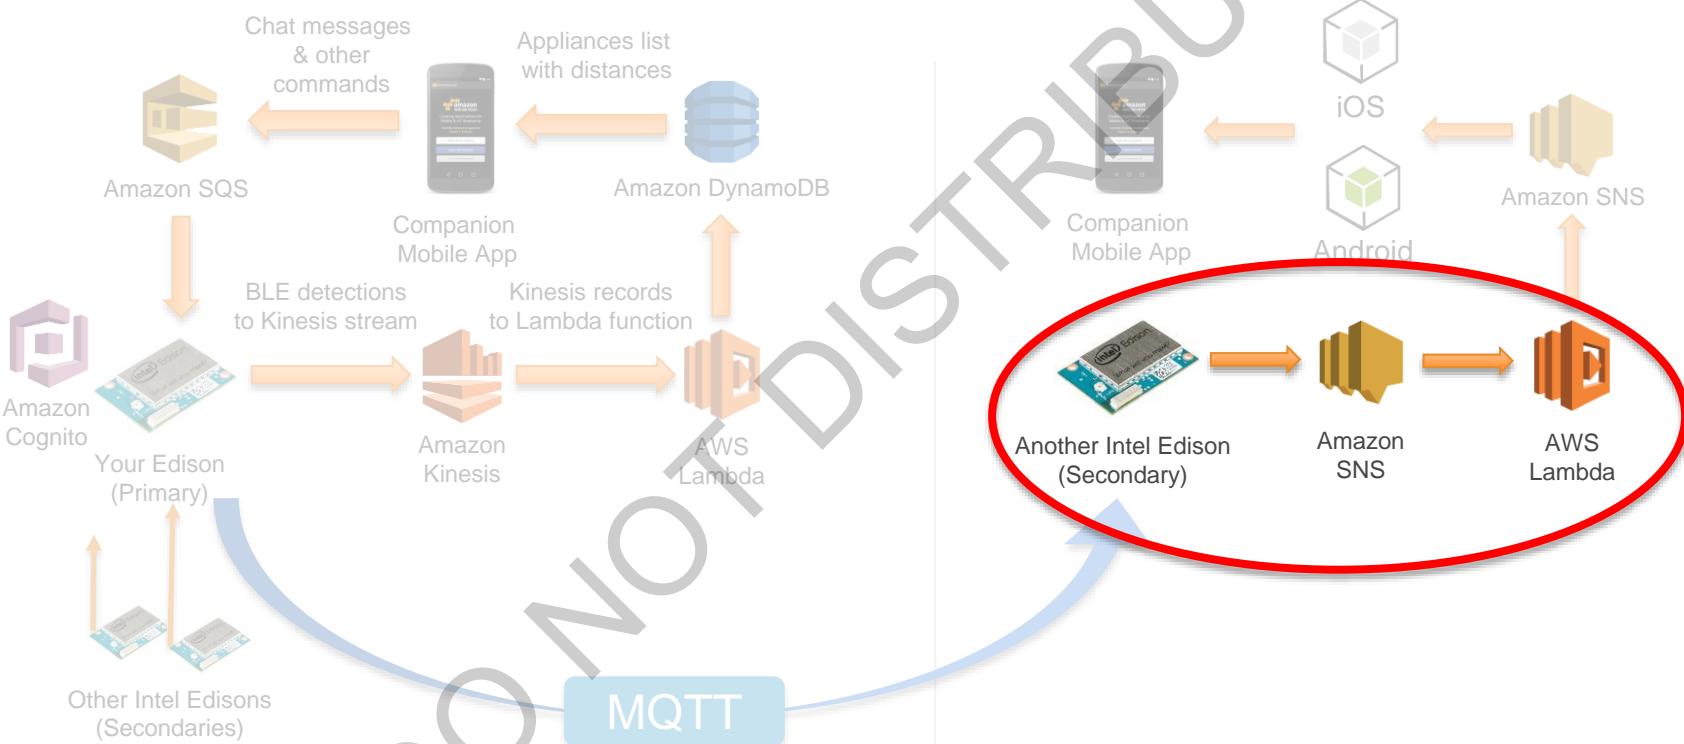

*So we need to ignore messages that our appliance initiates!*

# How our system uses MQTT

# System architecture

# Amazon SNS

Coordinates and manages the delivery or sending of messages to subscribing endpoints or clients

# Amazon SNS

## ■ Versatile

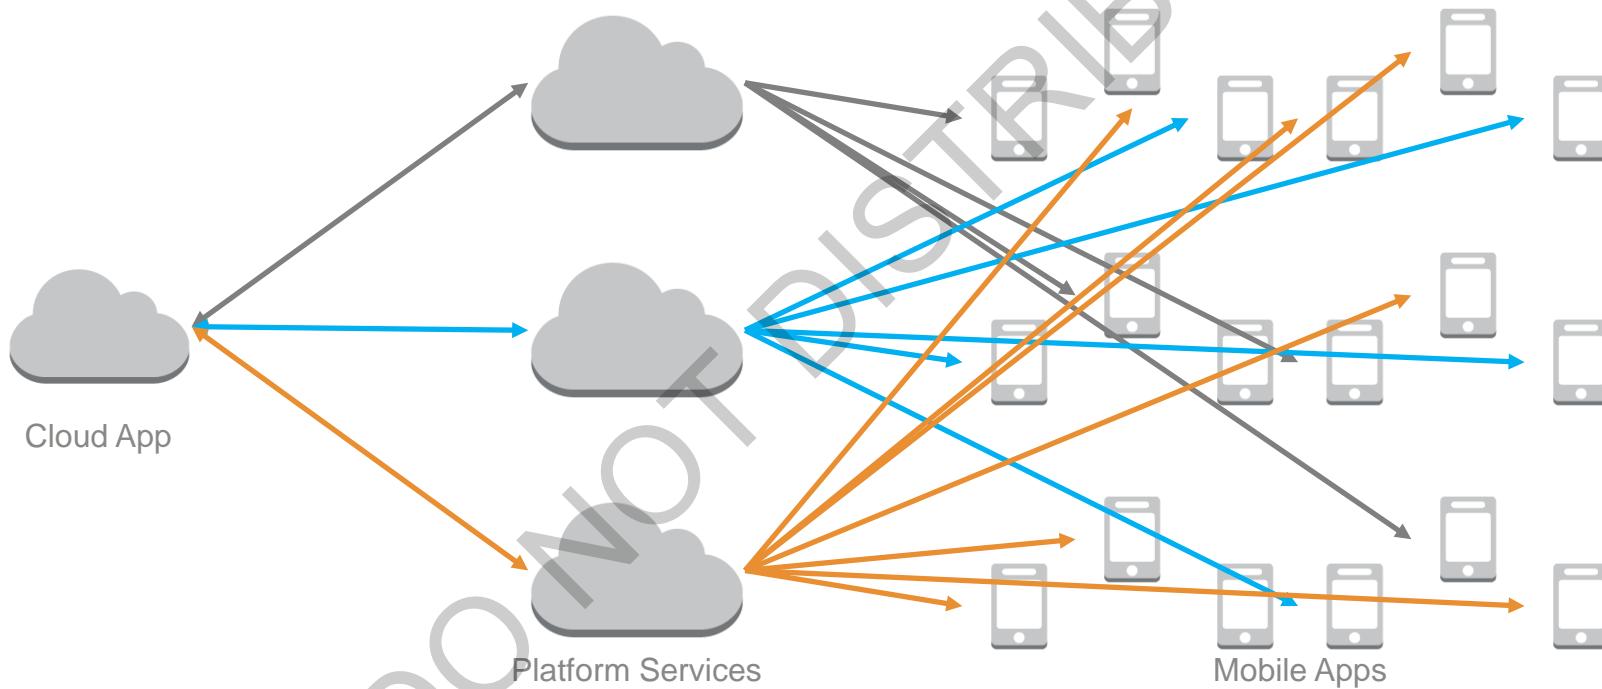

Send individual notifications or use ‘fan-out’ to send to large numbers of recipients

## ■ Flexible

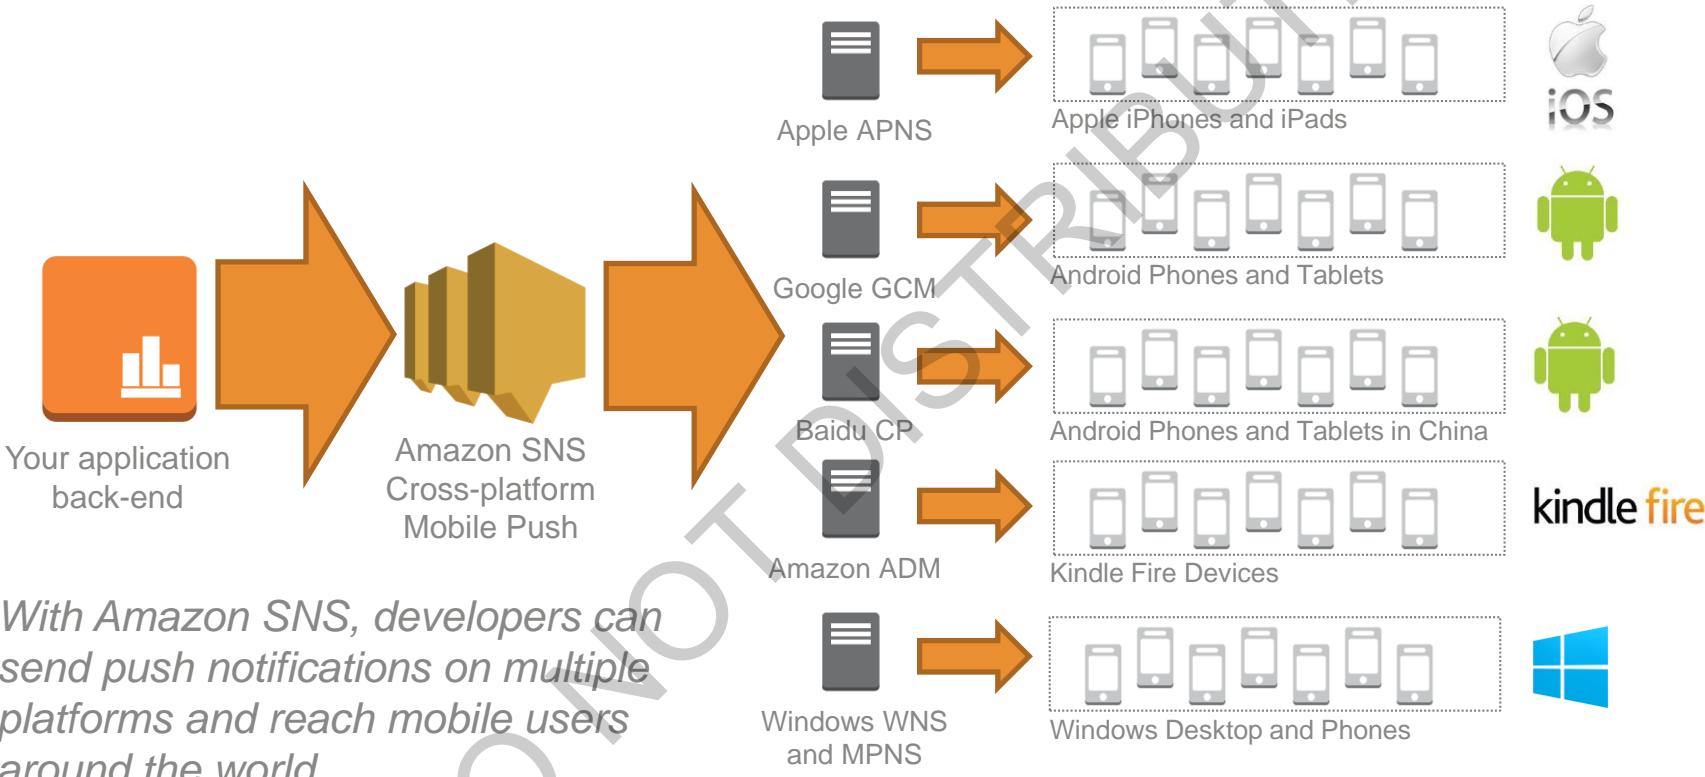

Send to **mobile devices**, email addresses, HTTP endpoints, Amazon SQS queues or even **AWS Lambda functions**

# Amazon SNS mobile push

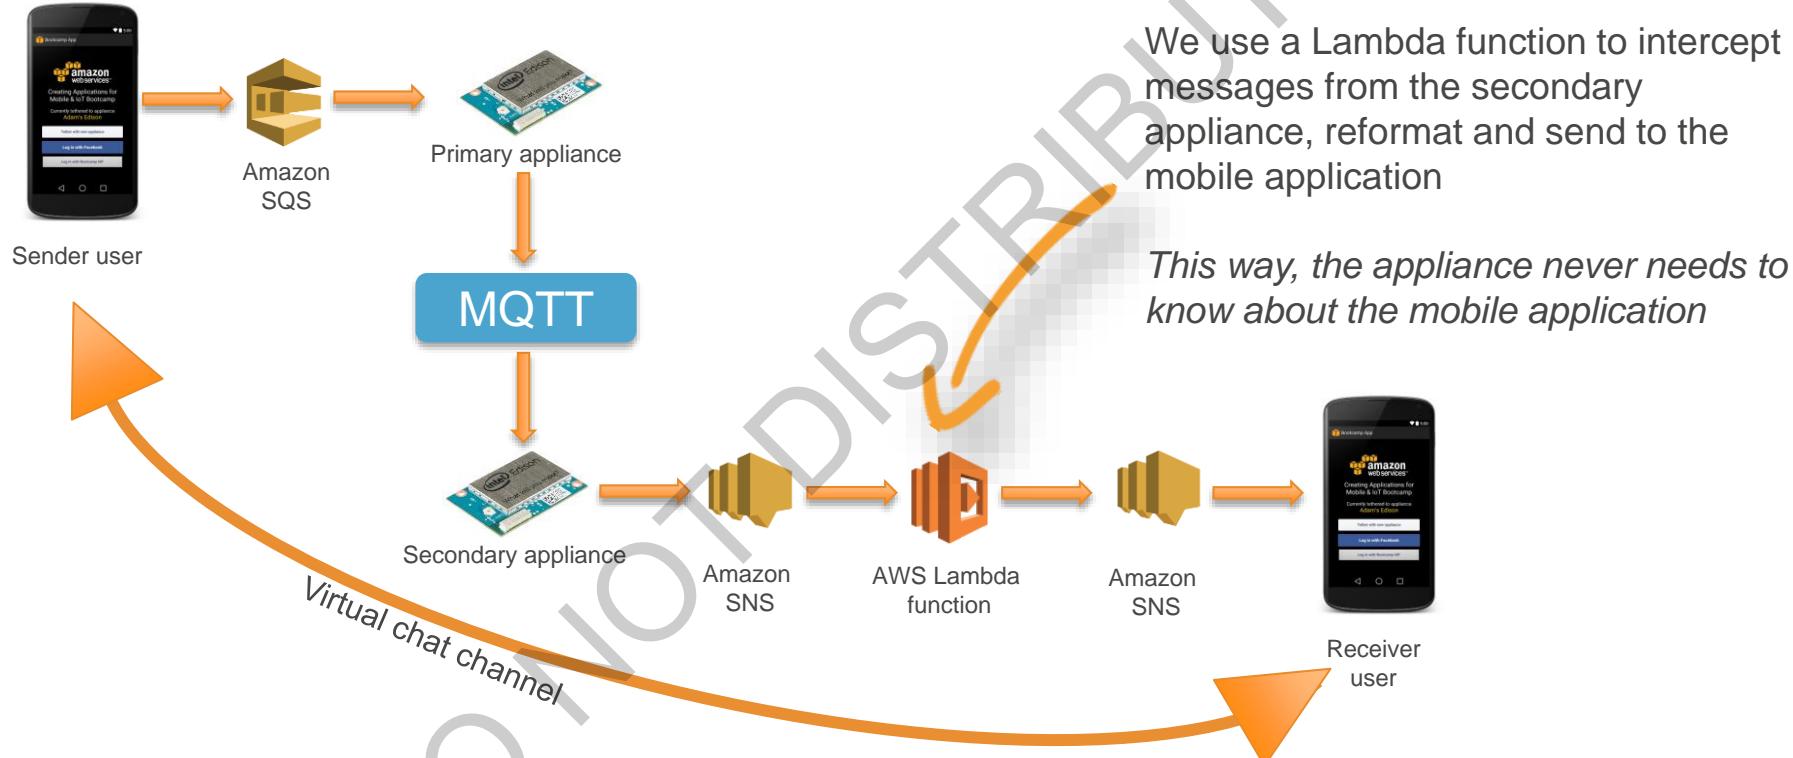

Each platform works differently, and push gets even more complex as you scale to support millions of devices.

# Amazon SNS mobile push

# How we use Amazon SNS in our system to implement chat

# LAB 6

Messaging with Amazon SQS,  
Amazon SNS & the MQTT protocol

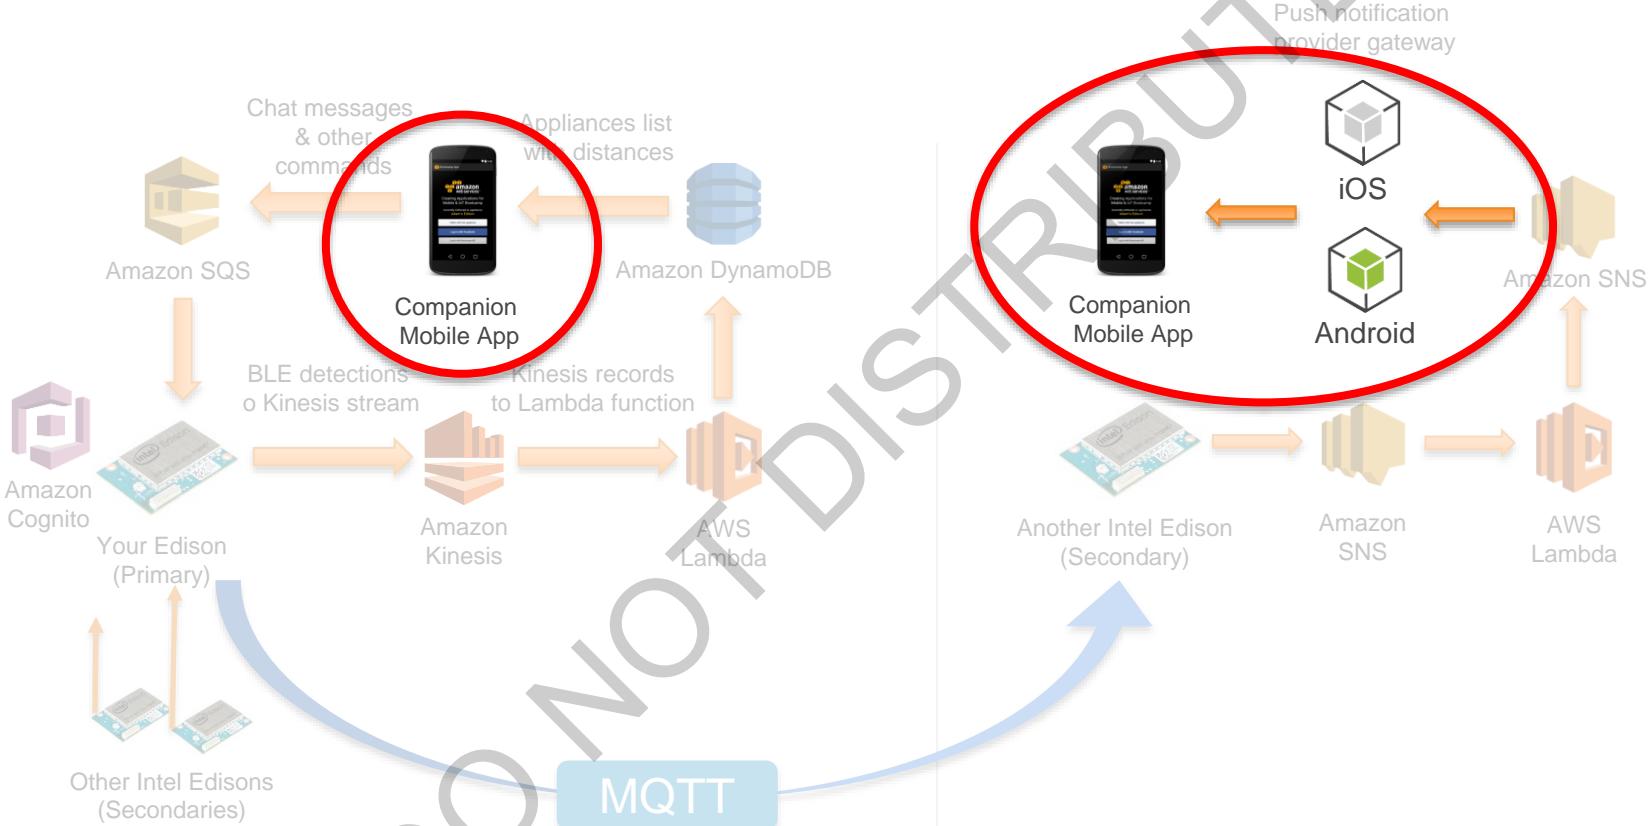

# Part 5

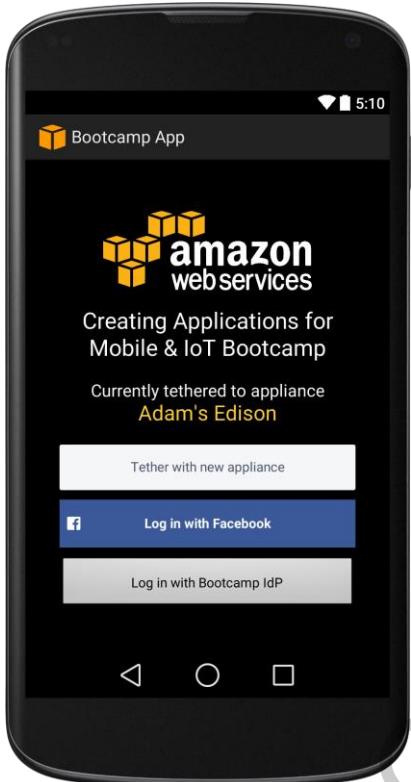

Creating the companion  
Mobile Application

# Sign-posting

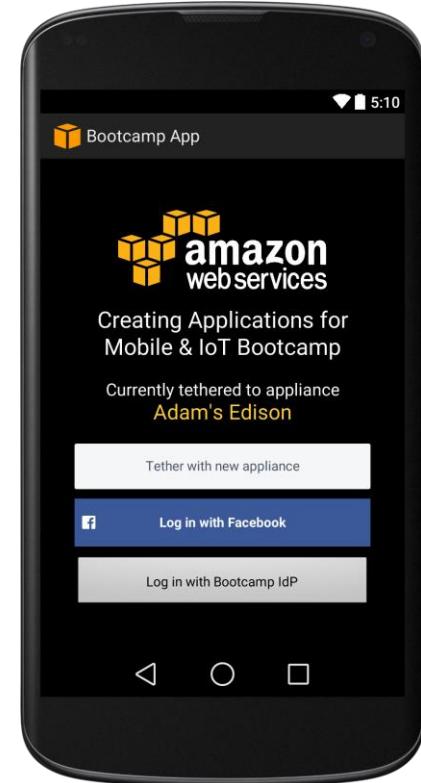

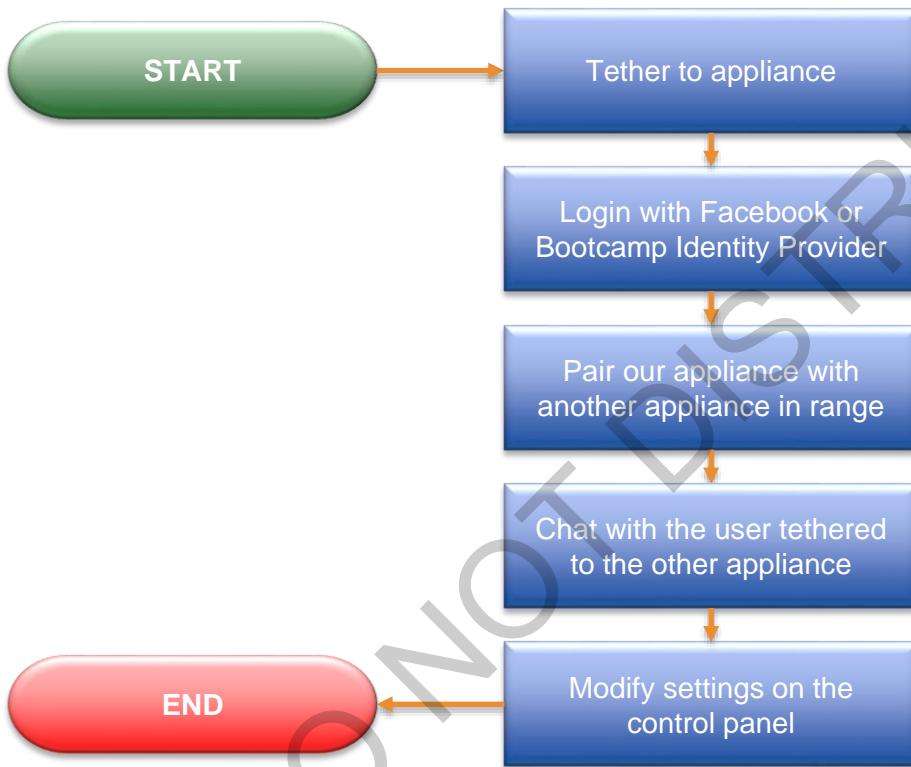

# Our Companion Mobile Application

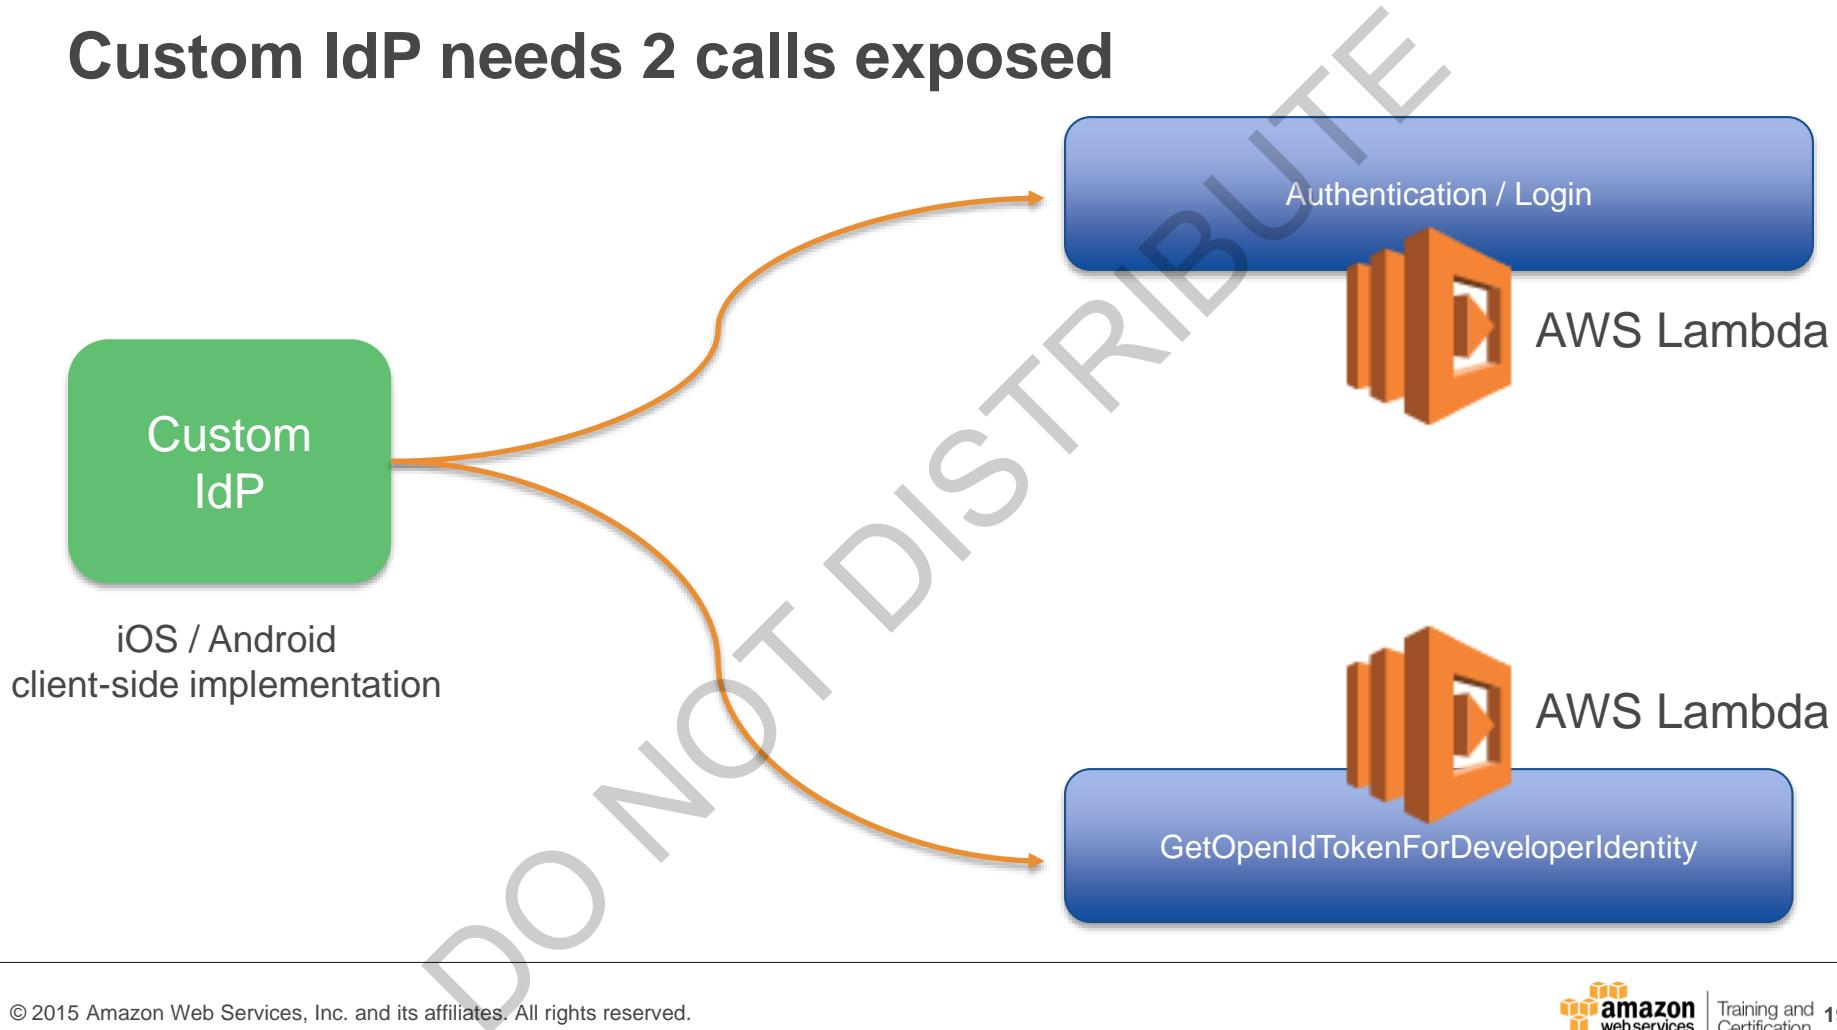

- ❖ Remotely controls our ‘appliances’
- ❖ Requires authentication
- ❖ Dynamically ‘tether’ to any appliance
- ❖ Provides control panels for appliances
- ❖ Implements Cognito Push Sync
- ❖ Demonstration ‘chat’ implementation

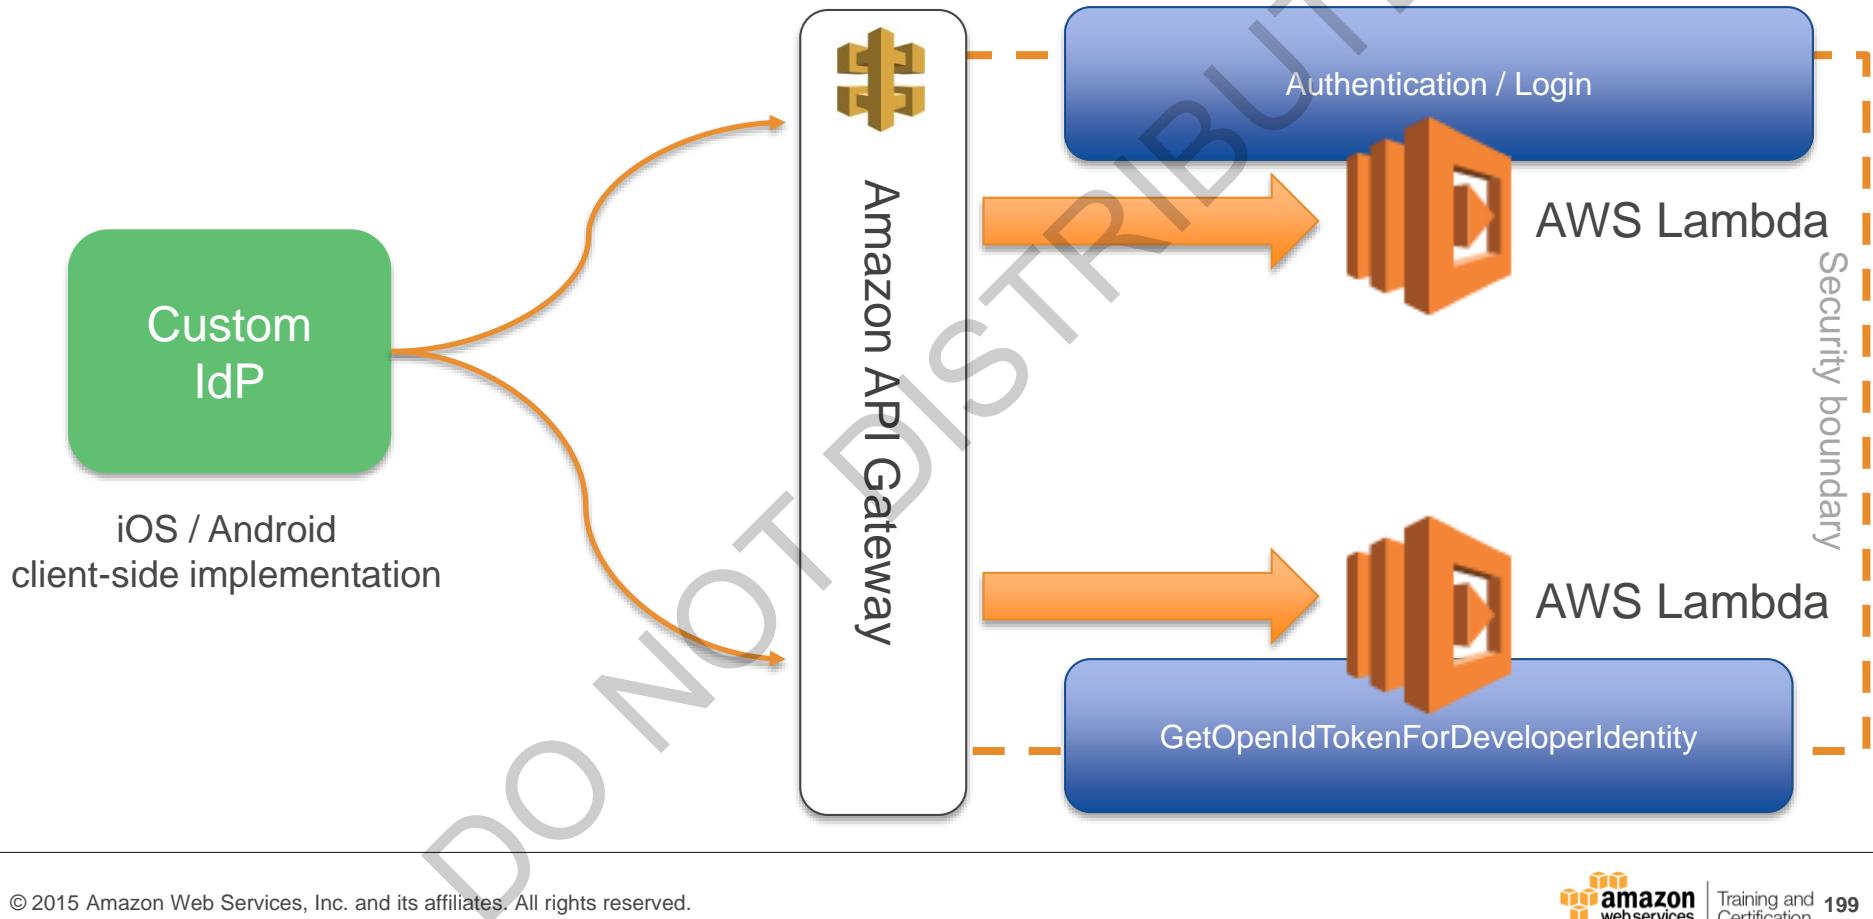

# Recap: User Workflow

# Custom IdP needs 2 calls exposed

# We will use Lambda via API Gateway

# Amazon API Gateway

Create, publish, maintain, monitor, and  
secure APIs at any scale

# Amazon API Gateway

## ■ Performance at Any Scale

Uses AWS worldwide edge locations for low-latency API request/response

## ■ Run Your APIs Without Servers

Easily expose RESTful endpoints backed by Lambda for server-less APIs for your mobile & web applications

## ■ Deploy, Generate SDKs & Monitor your API

Generate SDKs for iOS/Android & Javascript to streamline API development. Visually monitor calls to your services using Amazon CloudWatch for performance metrics

# Amazon API Gateway - concepts

## Resources

A resource is a logical entity that can be accessed in an API via its **resource path**

# Amazon API Gateway - concepts

A screenshot of the AWS Lambda console. At the top, there's a navigation bar with a book icon, 'AWS' dropdown, and 'Services' dropdown. Below it, a sidebar has a 'Lambda' icon and the text 'Amazon API Gateway'. The main area is titled 'Resources' and shows a tree structure. The root node is a blue folder icon with a '/' symbol. It has three children: a blue folder icon with '/login', a blue folder icon with '/gettoken', and a blue folder icon with '/'. The '/login' node is highlighted with a blue selection bar.

- /
- /login
- /gettoken

This is the  
resource path

<http://my.api.com/login>

login is a  
resource in the  
my.api.com API

# Amazon API Gateway - concepts

## Resources

A resource is a logical entity that can be accessed in an API via its **resource path**

## Methods

A method is identified by the combination of a **resource path** and an HTTP verb, such as **GET**, **POST**, and **DELETE**

## Models

A model defines the **format**, also known as the **schema** or **shape**, of some data inbound or outbound from the API

# Amazon API Gateway – Generating SDKs

## Generate SDKs from your API definition

API Gateway creates classes based on the models you define for your methods

The screenshot shows the 'SDK Generation' tab of the AWS API Gateway console. It includes fields for Platform (Android), Group ID (com.mycompany), Invoker package (com.mycompany.clientsdk), Artifact ID (Mycompany-client), and Artifact version (1.0.0). To the right, a code editor displays generated Java code for a 'loginPost' operation:

```
/**  
 *  
 *  
 * @param body  
 * @return LoginResponseModel  
 */  
@Operation(path = "/login", method = "POST")  
LoginResponseModel loginPost(  
    LoginRequestModel body  
);
```

Below the interface, icons for iOS and Android represent the platforms for which the SDK is being generated.

# Custom IdP – *Login* Lambda function

```
//  
// Authenticate this username/password - you would call out  
// password database for this - this is only for demonstration  
//  
if ( event.username === "username" && event.password === "password")  
{  
    context.succeed({ succeeded: true, message: "OK" });  
    console.log("Authentication succeeded");  
}  
else  
{  
    //  
    // FAILED to authenticate!  
    //  
    context.succeed({ succeeded: false, message: "BootcampIdP has failed" })  
}
```

INTERFACE

IN:	username
IN:	password
OUT:	succeeded
OUT:	message

*NOTE: This code is not production ready! There is no authentication in use – we have skipped this in this Bootcamp, to make it more clear for instructional purposes, but you must add encryption when you use this in production.*

# Custom IdP – GetToken Lambda function

*NOTE: This code is not production ready! There is no authentication in use – we have skipped this in this Bootcamp, to make it more clear for instructional purposes, but you must add encryption when you use this in production.*

OUT: errorType  
OUT: identityId  
OUT: token
```

## getOpenIdTokenForDeveloperIdentity

AWS API call to generate the OpenID token from the supplied IdentityPoolId & provided logins

```
var cognitoidentity = new AWS.CognitoIdentity();  
var params =  
{  
    IdentityId      : event.cognitoId,  
    IdentityPoolId  : COGNITO_IDENTITY_POOL_ID,  
    Logins          : {}  
};  
  
if ( event.bootcampAuth !== null && event.bootcampAuth !== "" )  
{  
    params.Logins["idp.custom.bootcamp2015"] = event.bootcampAuth;  
}  
  
if ( event.facebookAuth !== null && event.facebookAuth !== "" )  
{  
    params.Logins["graph.facebook.com"] = event.facebookAuth;  
}  
  
console.log(JSON.stringify(params));  
  
cognitoidentity.getOpenIdTokenForDeveloperIdentity(  
    params,  
    function (err, data)  
    {  
        if (err) {  
            console.log("Error", err);  
        } else {  
            console.log("Success", data);  
        }  
    }  
)
```

# Custom IdP – GetToken Lambda function

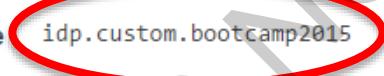

```
var cognitoidentity = new AWS.CognitoIdentity();
var params =
{
  IdentityId      : event.cognitoId,
  IdentityPoolId  : COGNITO_IDENTITY_POOL_ID,
  Logins          : {}
```

## ▼ Authentication providers

Amazon Cognito recognizes tokens from these public identity providers. If you allow your users to sign in with multiple providers, you can add them here. You can also add your own custom provider. To do this, click the "Custom" tab and enter a developer provider name. This value must be unique across all applications in your account. You can't change this value after you've created your application.

If you want to authenticate your own identities, a developer provider name is required. A provider name is a unique identifier for your custom identity provider backend, so use a name that will identify your application to Cognito. Once set, this value cannot be changed.

Developer provider name  idp.custom.bootcamp2015

```
  if (bootcampAuth !== null && event.bootcampAuth !== "") {
    params["idp.custom.bootcamp2015"] = event.bootcampAuth;
  }

  if (facebookAuth !== null && event.facebookAuth !== "") {
    params["graph.facebook.com"] = event.facebookAuth;
  }

  var paramsString = JSON.stringify(params);

  cognitoidentity.getOpenIdTokenForDeveloperIdentity(
    params,
    function (err, data)
    {
```

# Lab 7 – Developer Authentication Lambda function

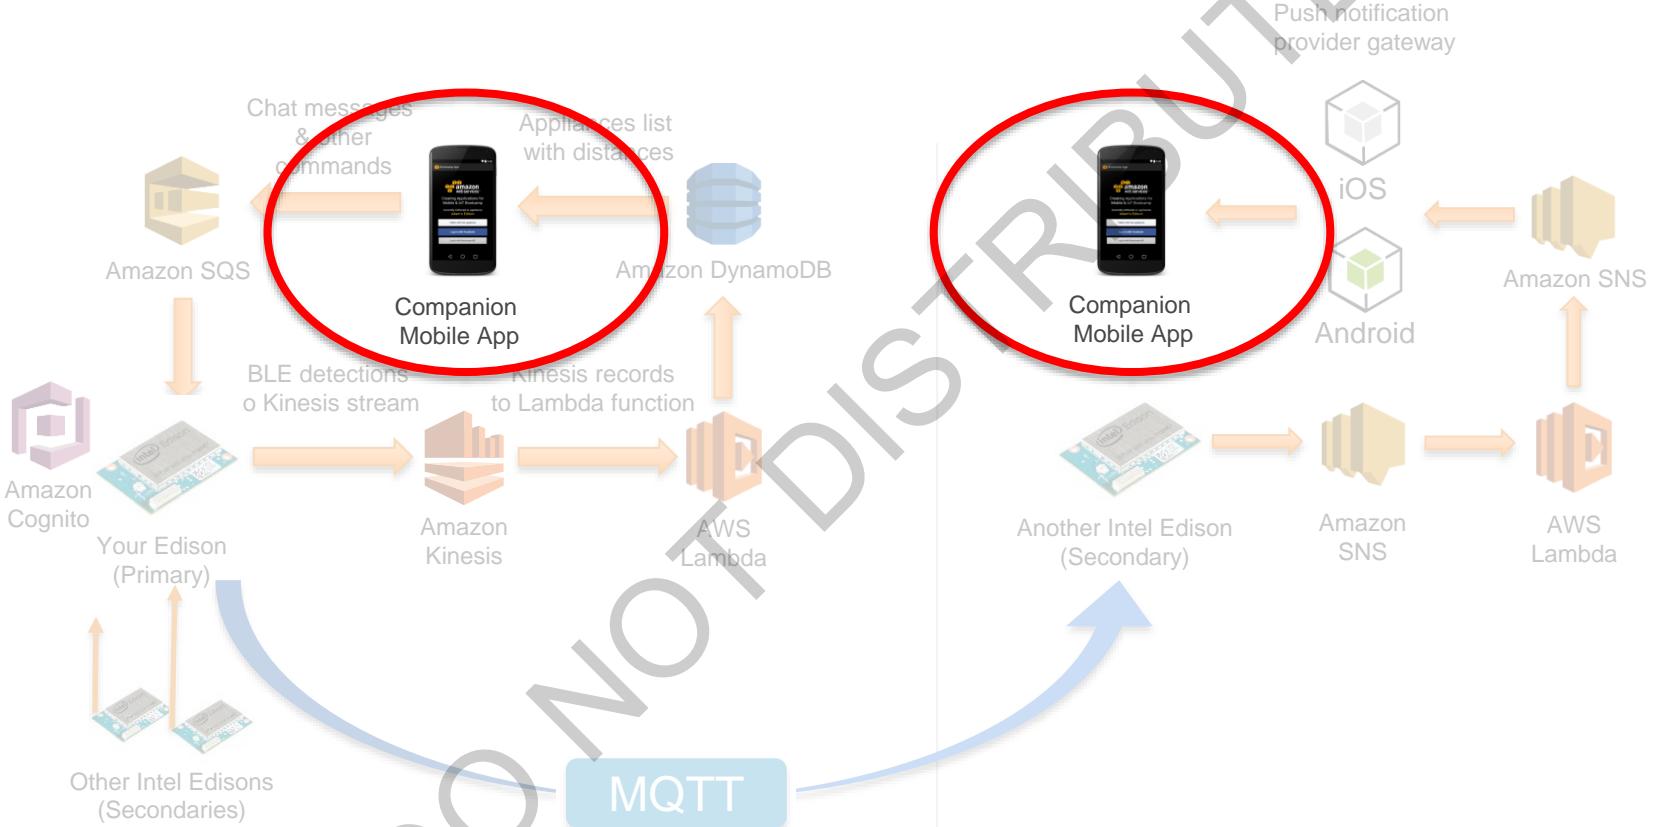

```
//////////  
//  
// Configuration  
//  
//////////  
  
var COGNITO_IDENTITY_POOL_ID = "ENTER COGNITO IDENTITY POOL ID HERE";
```

# LAB 7

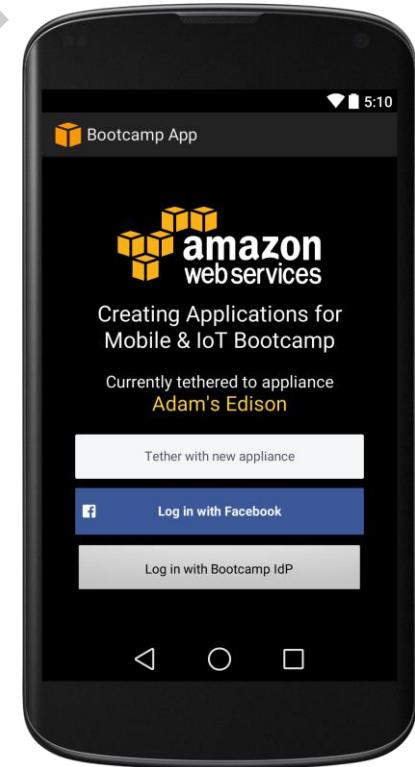

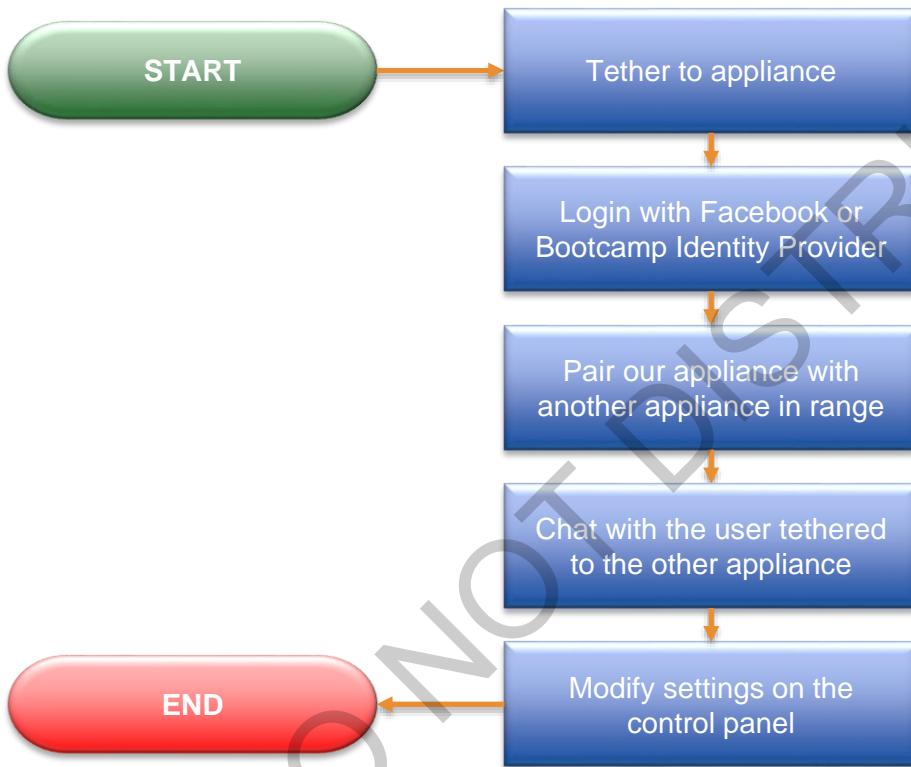

Implement Developer Authentication for  
our Mobile app, using Amazon API  
Gateway and AWS Lambda functions

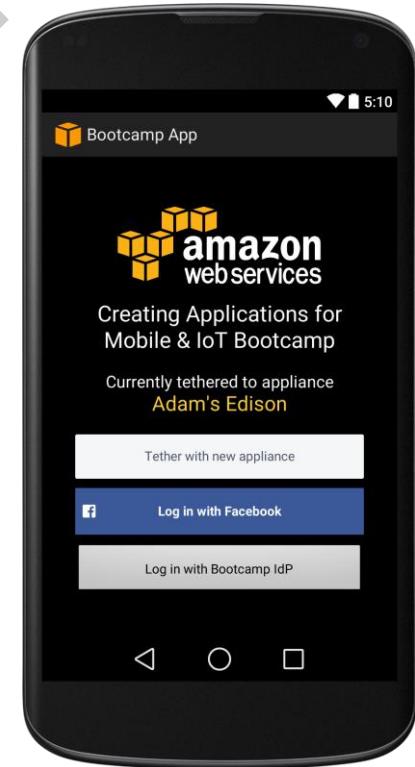

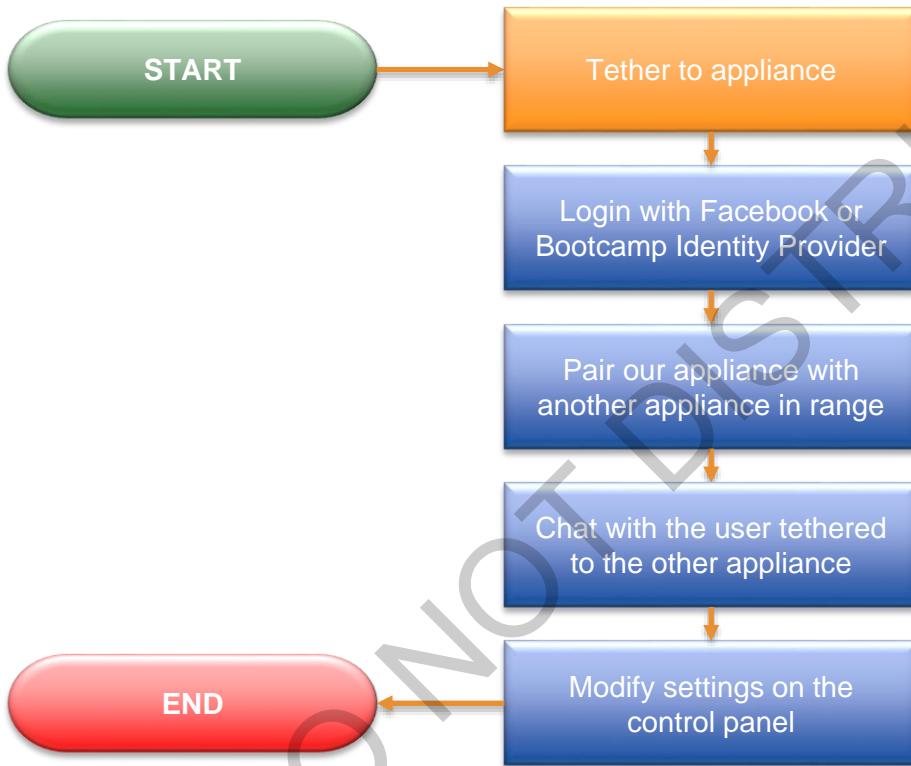

# Sign-posting

# Recap: User Workflow

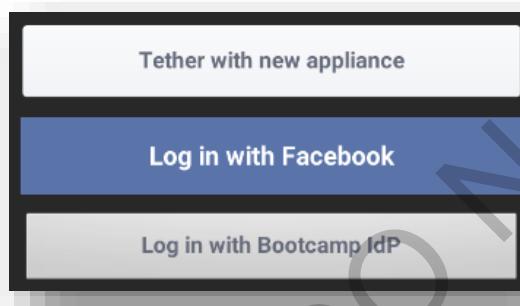

# Recap: User Workflow

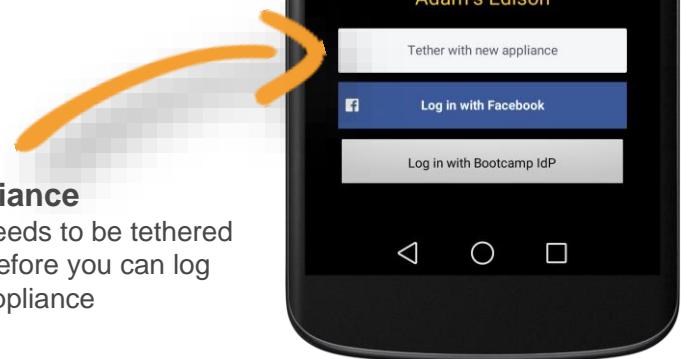

# The ‘login’ panel – step 1: tethering

‘Tethering’ associates the mobile application with a specific IoT device identified by a UUID, downloading the configuration from the Central web site so the mobile app knows about the Amazon SQS queue, Amazon Cognito Identity Pool and other configuration items

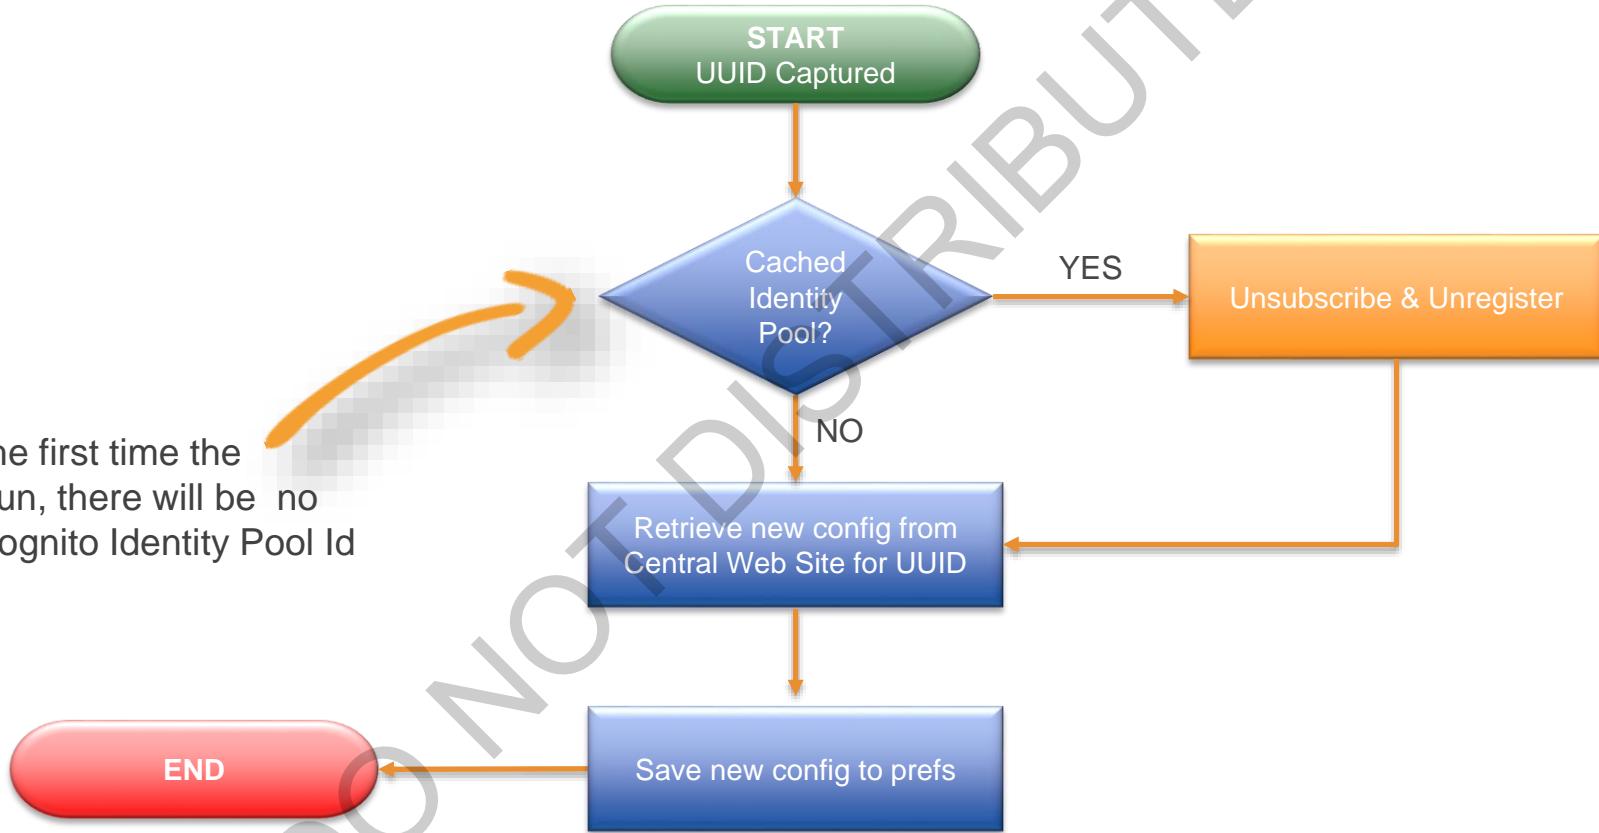

## Step 1 – Tether appliance

The mobile application needs to be tethered to a specific IoT device before you can log in and interact with the appliance

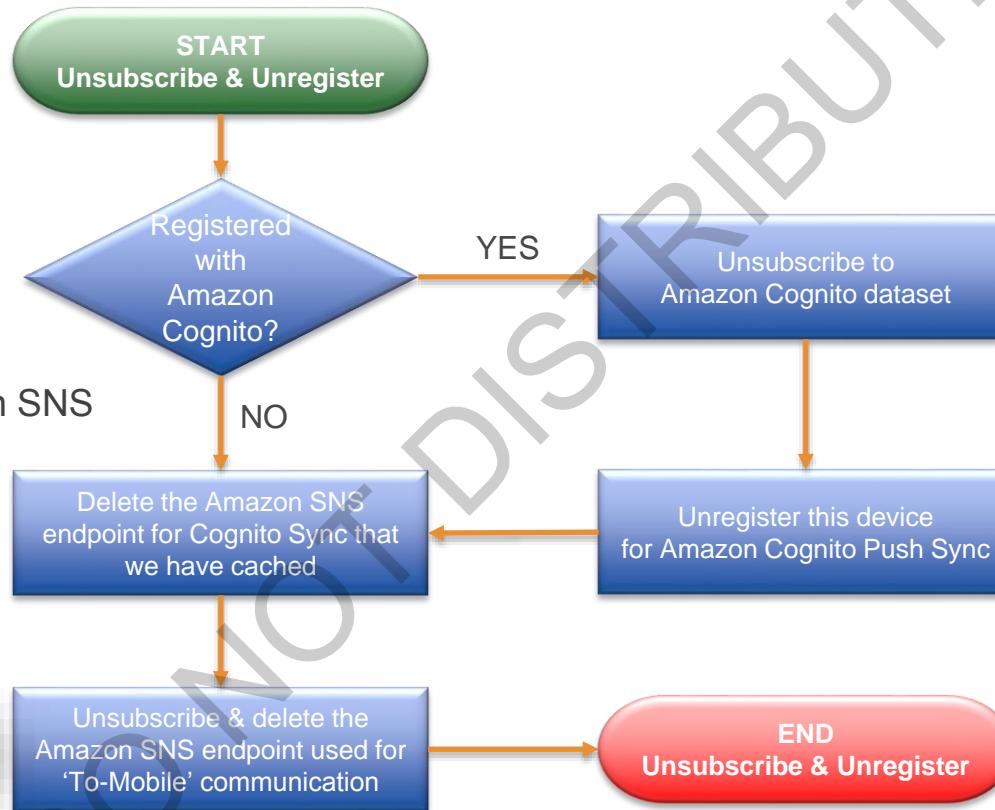

# Tether workflow

If this is the first time the app has run, there will be no cached Cognito Identity Pool Id

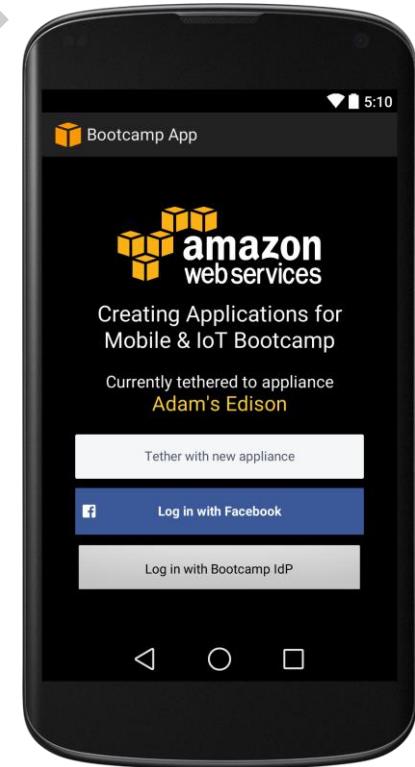

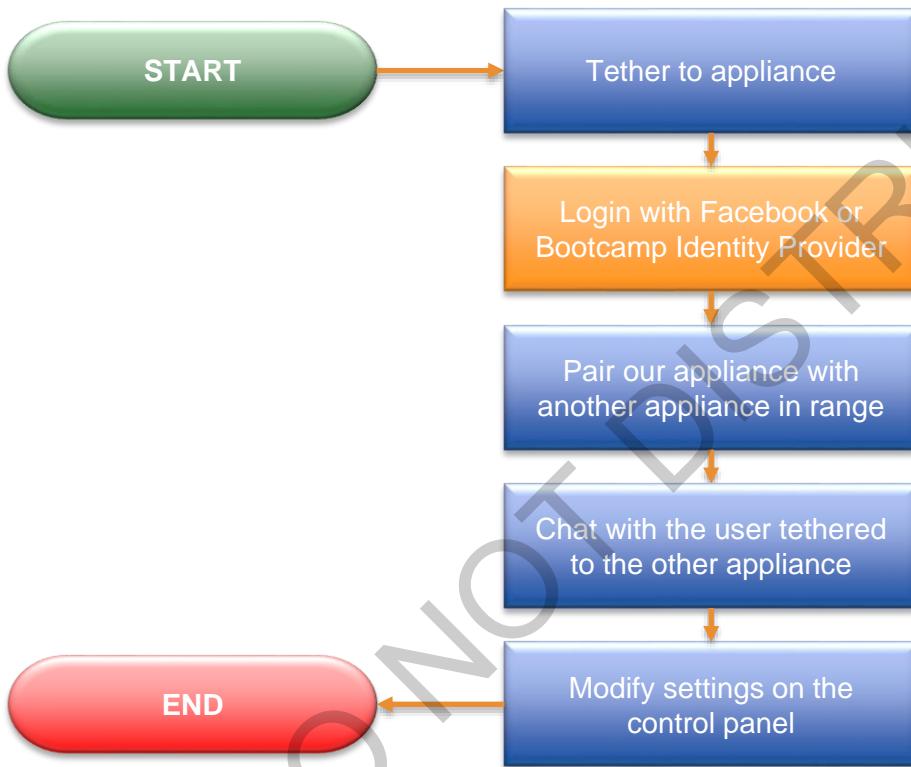

# Tether workflow – Unsubscribe & Unregister

We ‘clean up’ all Amazon SNS endpoints and subscriptions when we change tethering

# Recap: User Workflow

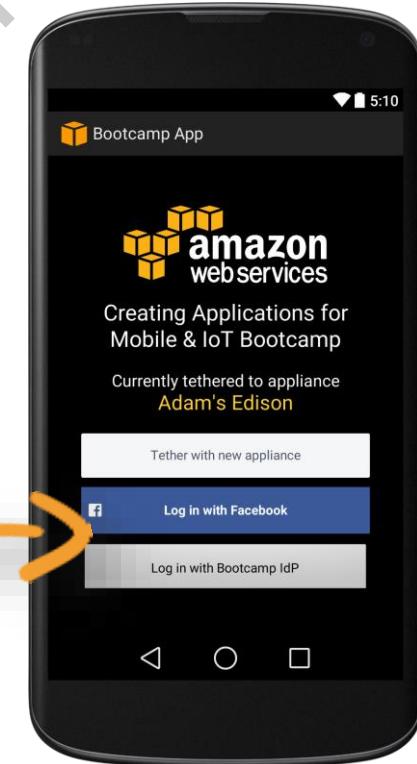

# The ‘login’ panel – step 2: authentication

Once tethered, the user can choose to authenticate using Facebook or the Bootcamp Identity Provider (IdP)

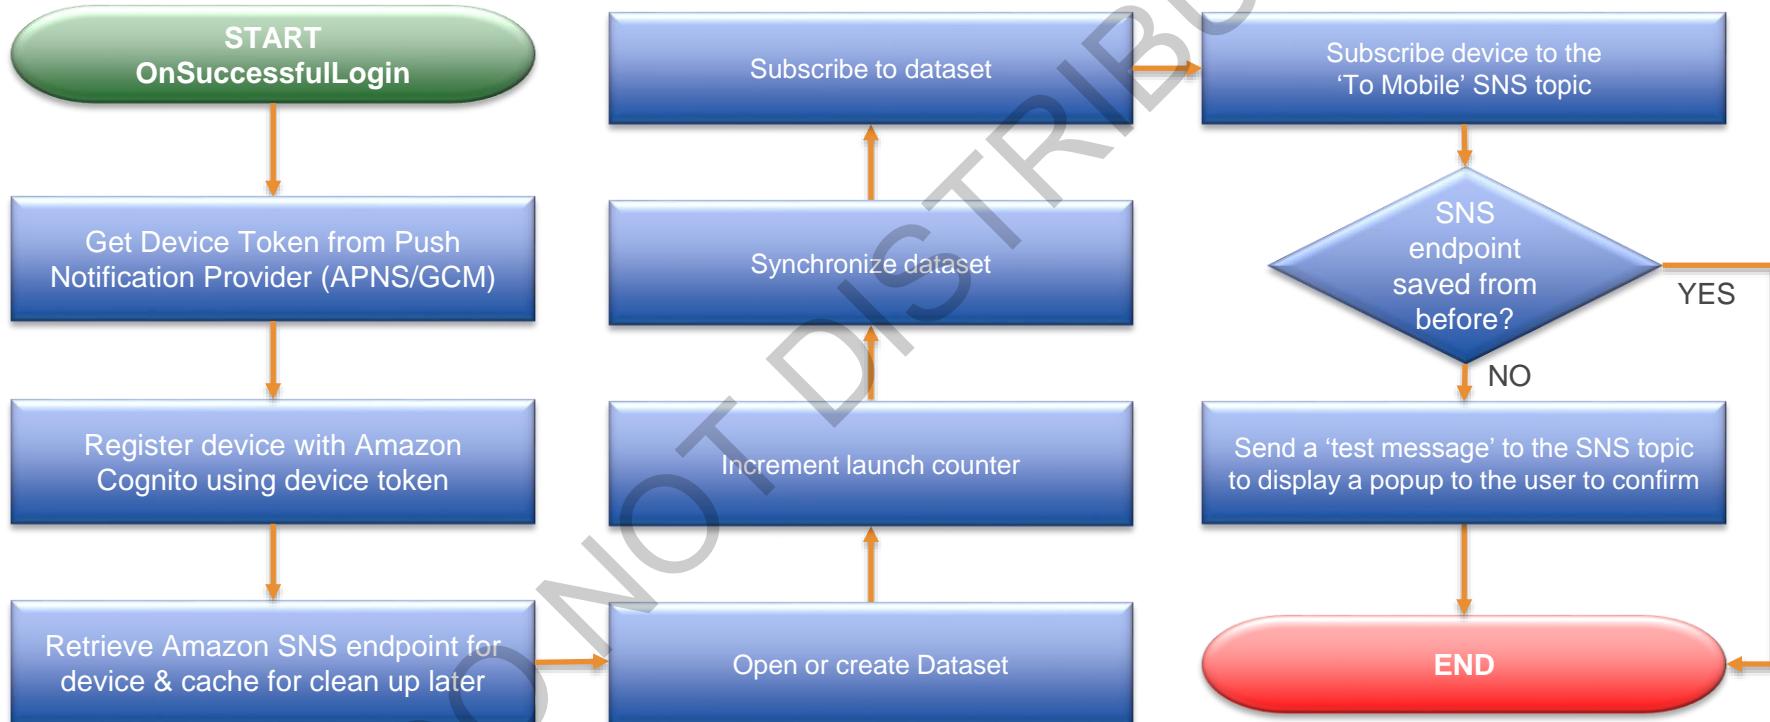

You must provide ‘*username*’ for the user name, and ‘*password*’ for the password to successfully authenticate

## Step 2 – Authenticate

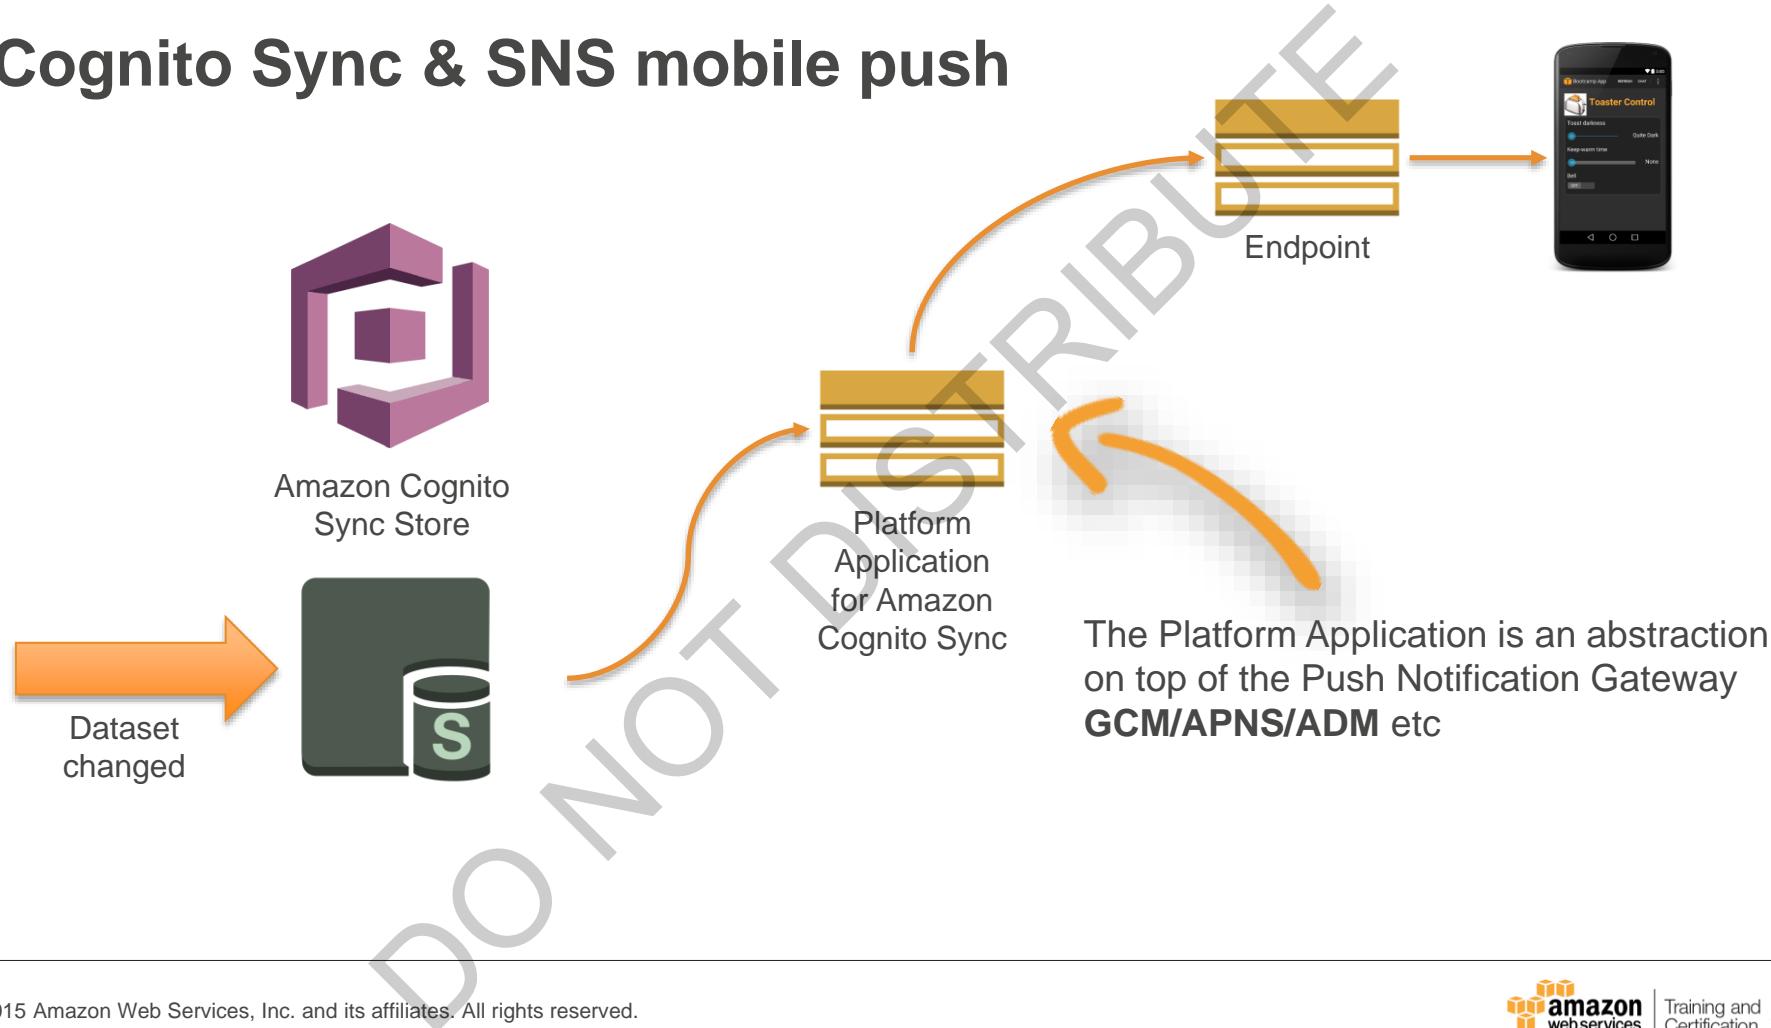

Once authenticated, the app behaves the same regardless of whether the User authenticated with Facebook or the Bootcamp Identity Provider

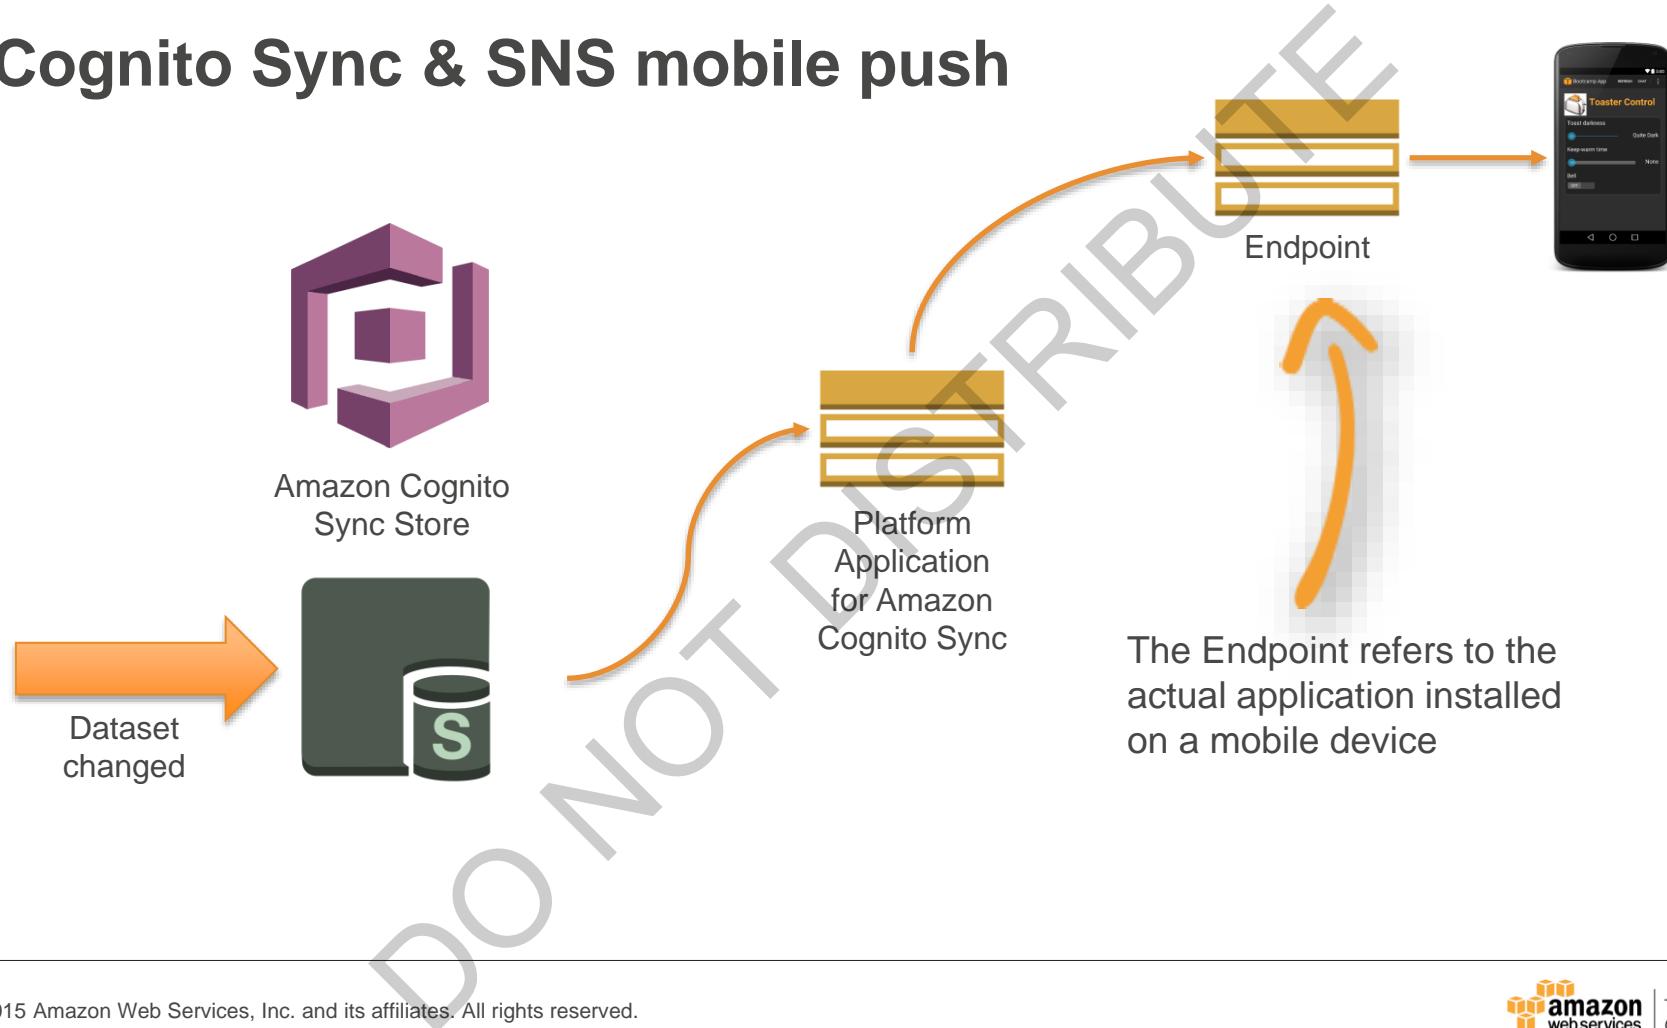

# Login workflow – post authentication

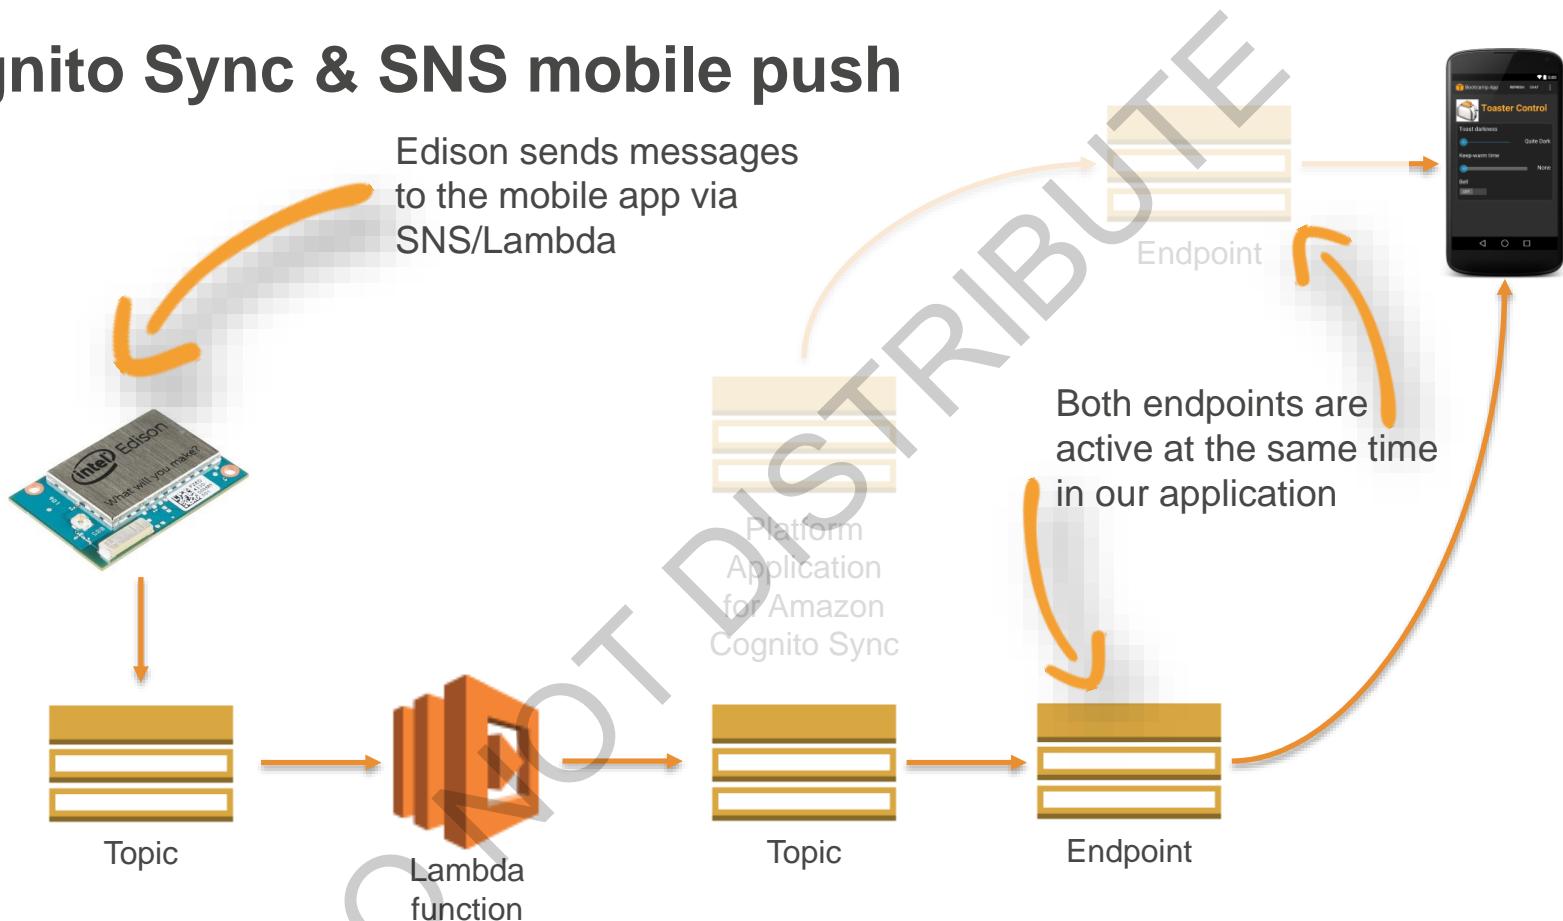

# Cognito Sync & SNS mobile push

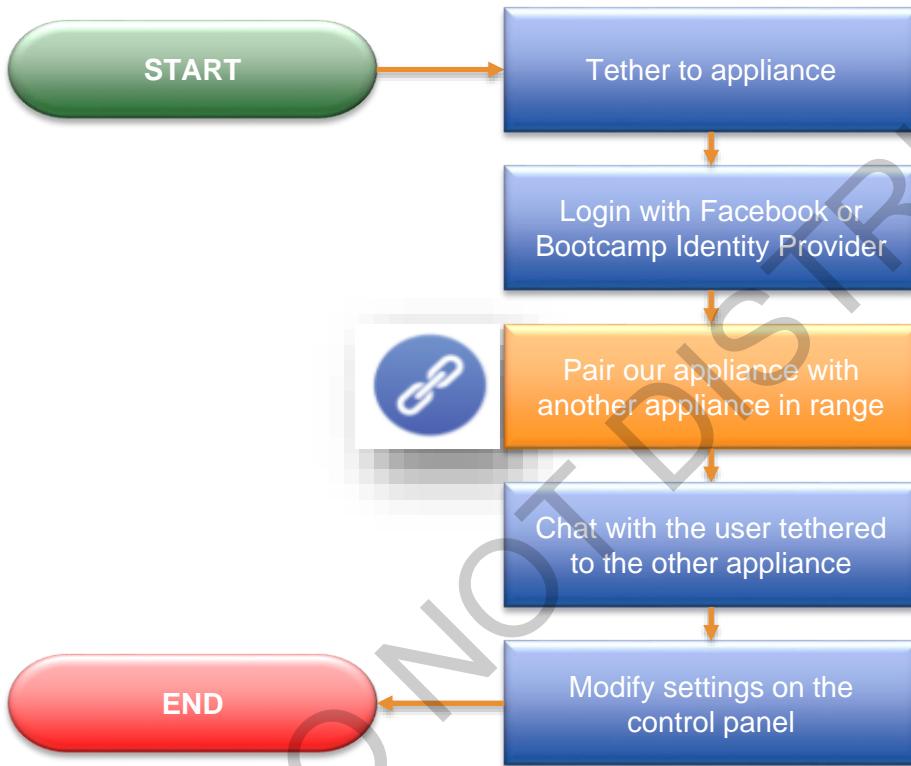

# Cognito Sync & SNS mobile push

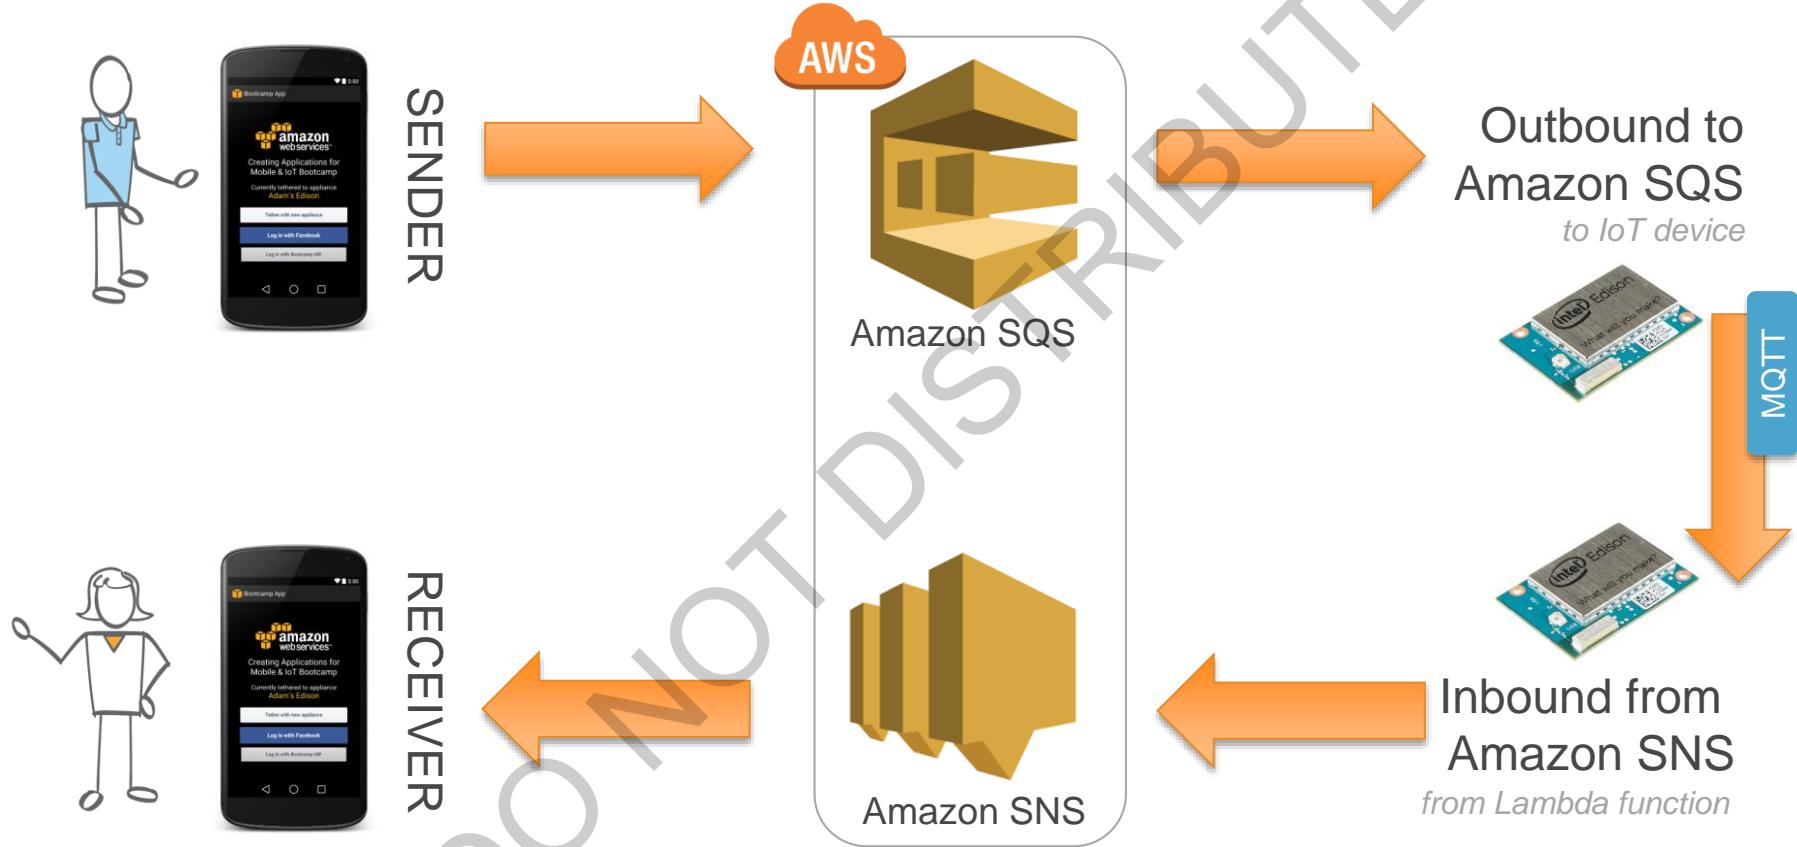

# Cognito Sync & SNS mobile push

# Recap: User Workflow

# Data-flow is easy to remember!

# Pairing

# Pairing

## SQS Queue

*Bootcamp2015-Edison-Command*

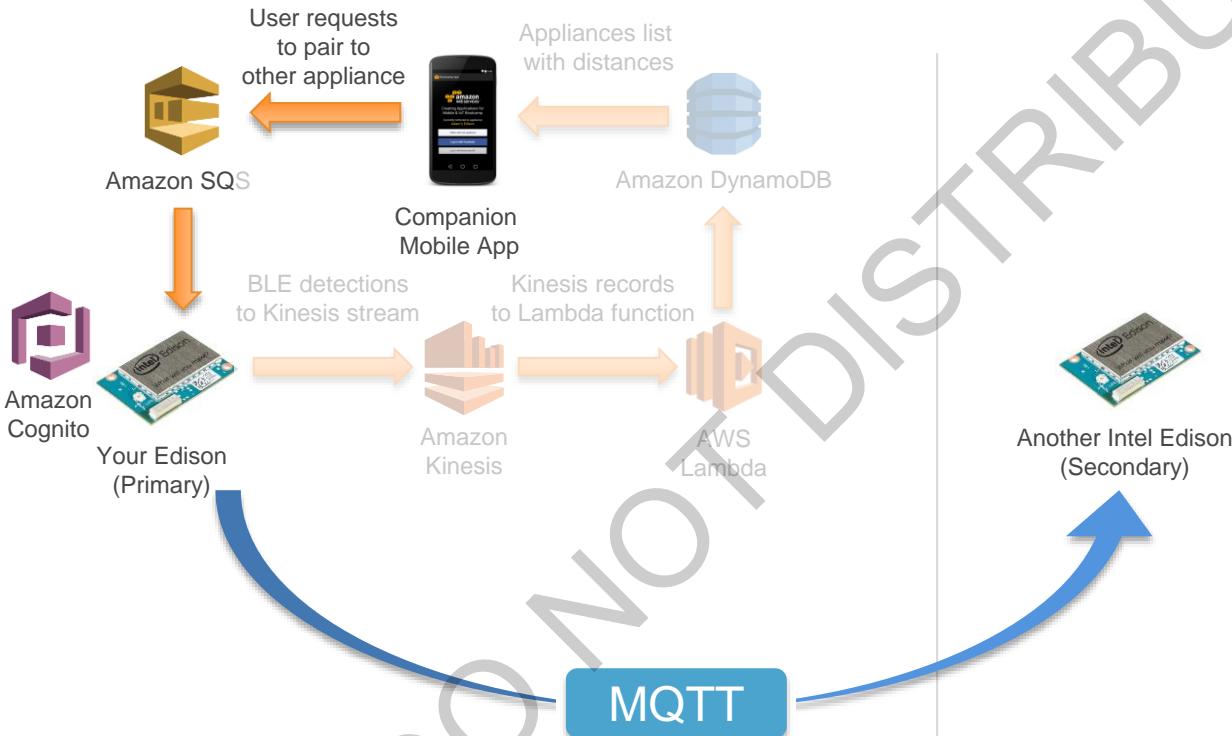

- All command traffic from mobile app is sent to this queue
- Pairing requests, chat messages, chat acknowledgements
- Edison code reads queue with a ‘long poll’ and dispatches messages

# Pairing

# Pairing

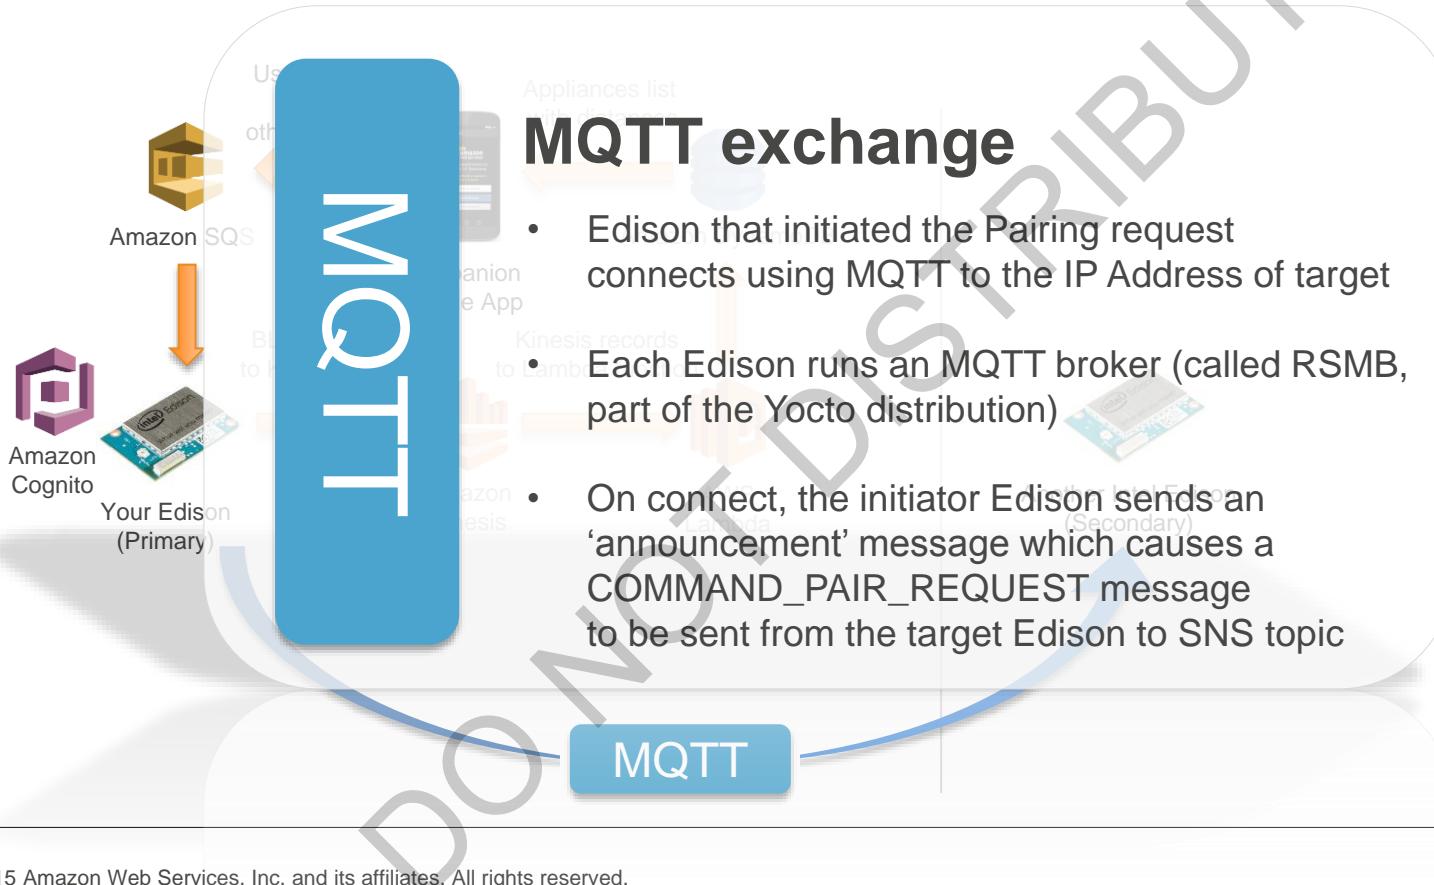

# Pairing

## MQTT exchange

- Edison that initiated the Pairing request connects using MQTT to the IP Address of target
- Each Edison runs an MQTT broker (called RSMB, part of the Yocto distribution)
- On connect, the initiator Edison sends an ‘announcement’ message which causes a COMMAND\_PAIR\_REQUEST message to be sent from the target Edison to SNS topic

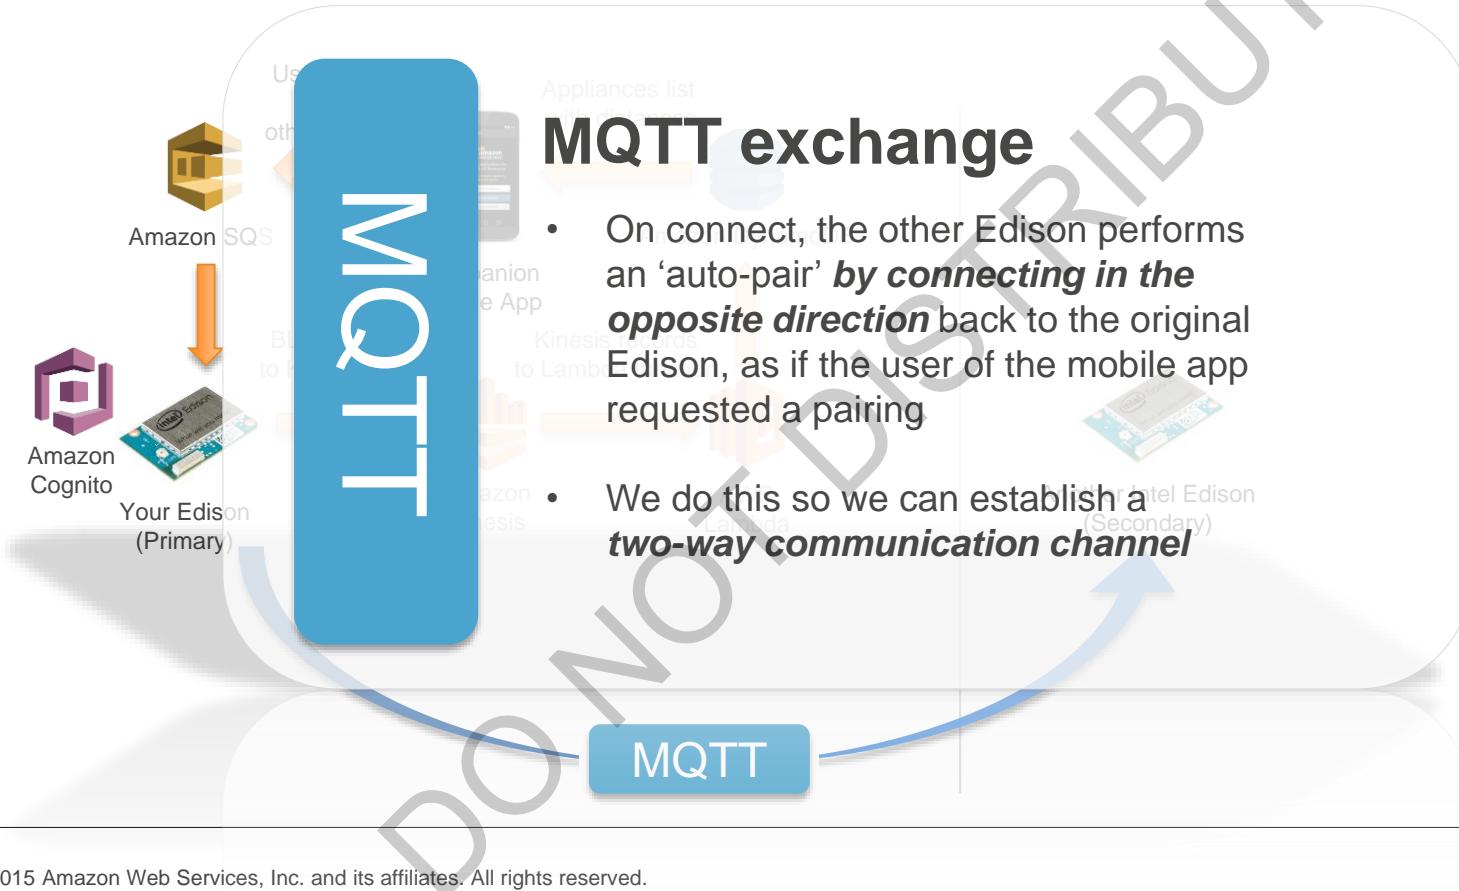

MQTT

# Pairing

## MQTT exchange

- On connect, the other Edison performs an ‘auto-pair’ **by connecting in the opposite direction** back to the original Edison, as if the user of the mobile app requested a pairing.
- We do this so we can establish a **two-way communication channel**

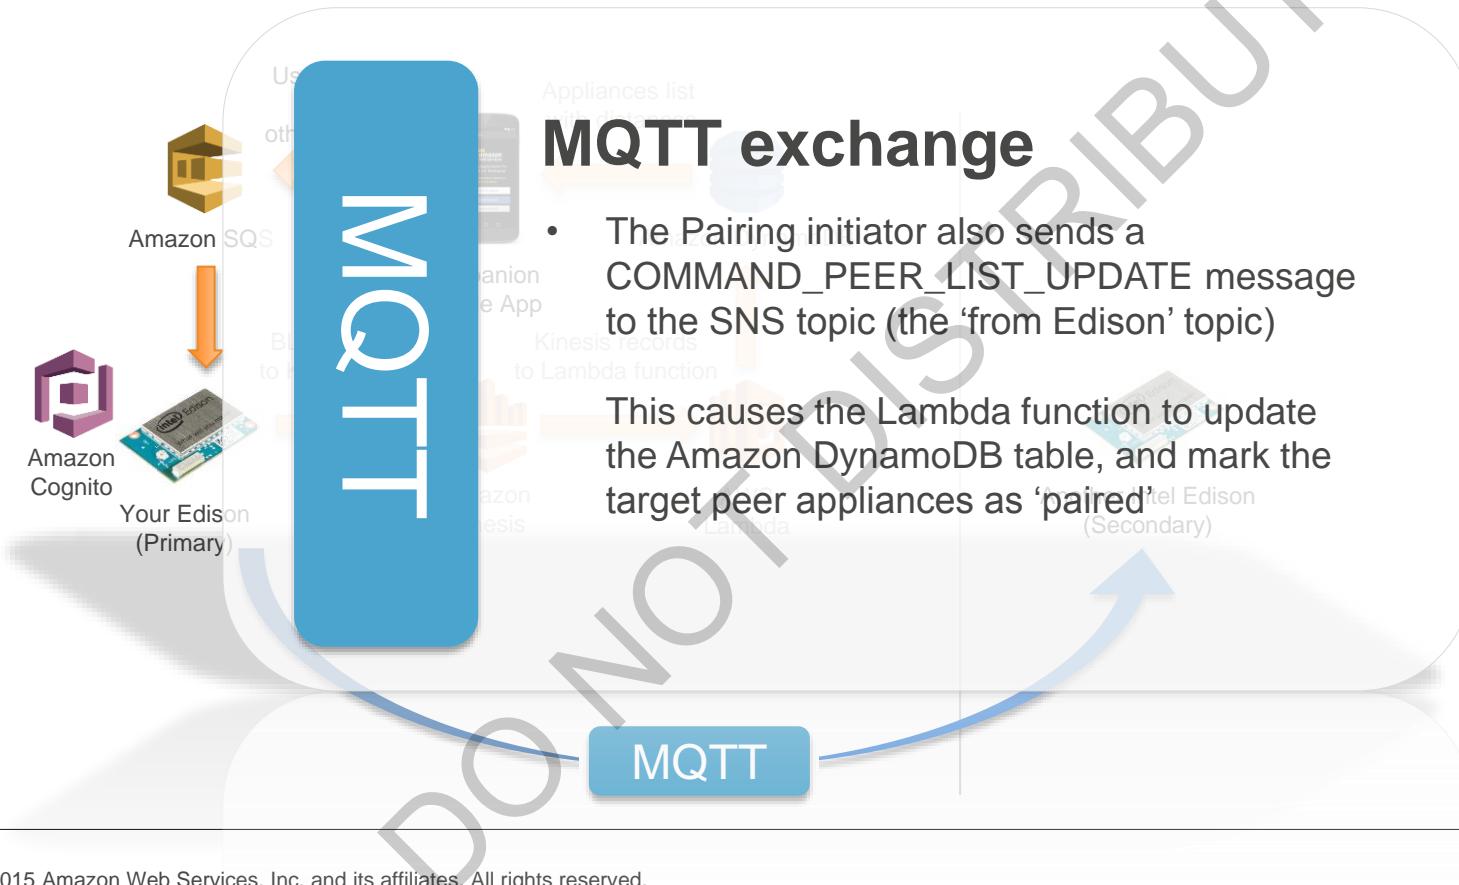

# Pairing

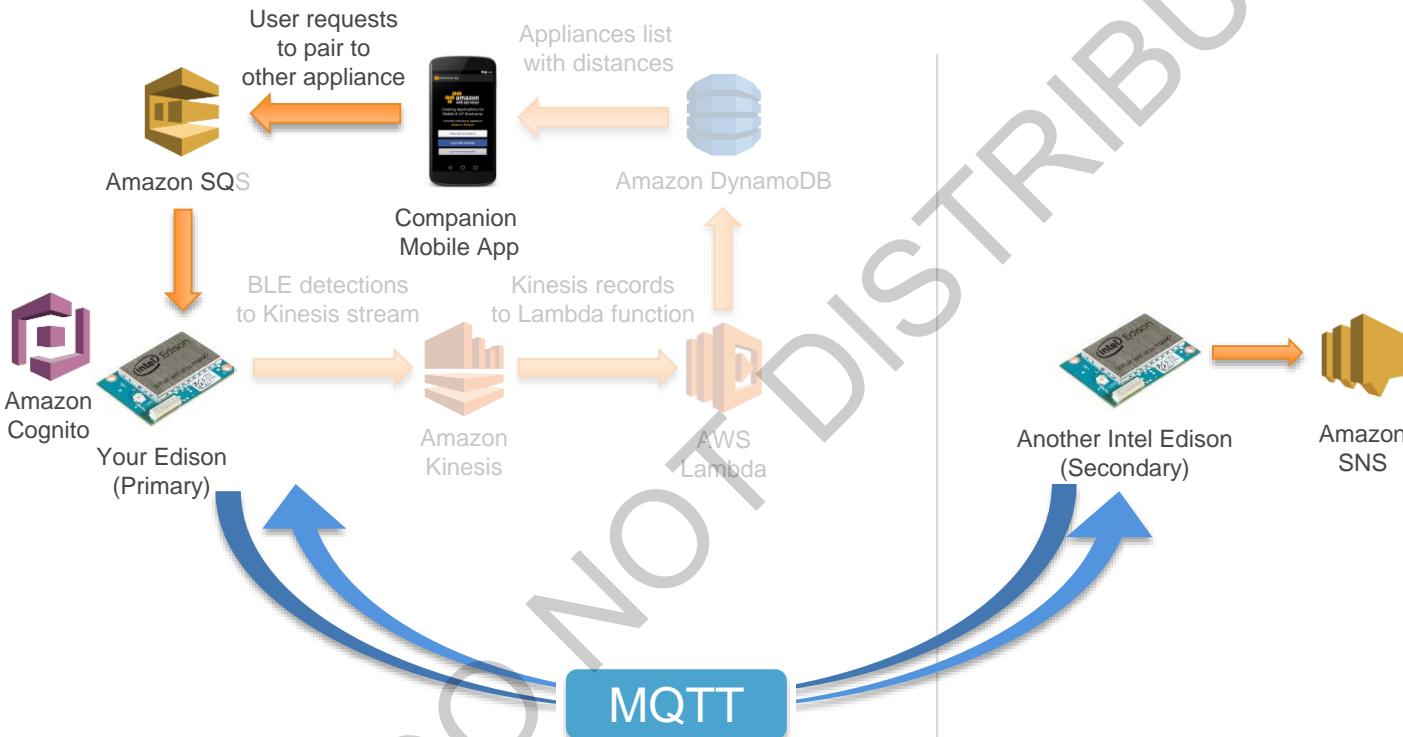

## MQTT exchange

- The Pairing initiator also sends a **COMMAND\_PEER\_LIST\_UPDATE** message to the SNS topic (the ‘from Edison’ topic)

This causes the Lambda function to update the Amazon DynamoDB table, and mark the target peer appliances as ‘paired’.

# Pairing

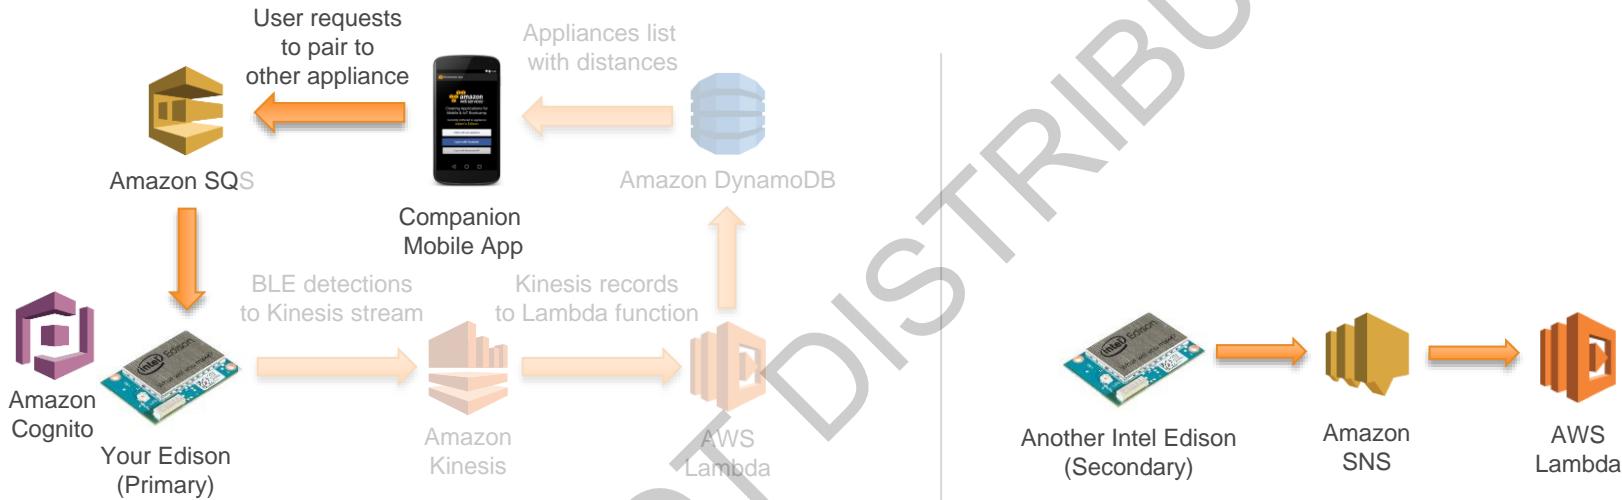

# Pairing

## SNS Topic *Bootcamp2015-From-Edison*

- All command traffic from Edison bound for mobile app is sent to this topic
- This is **not** the topic that the mobile app is subscribed to

# Pairing

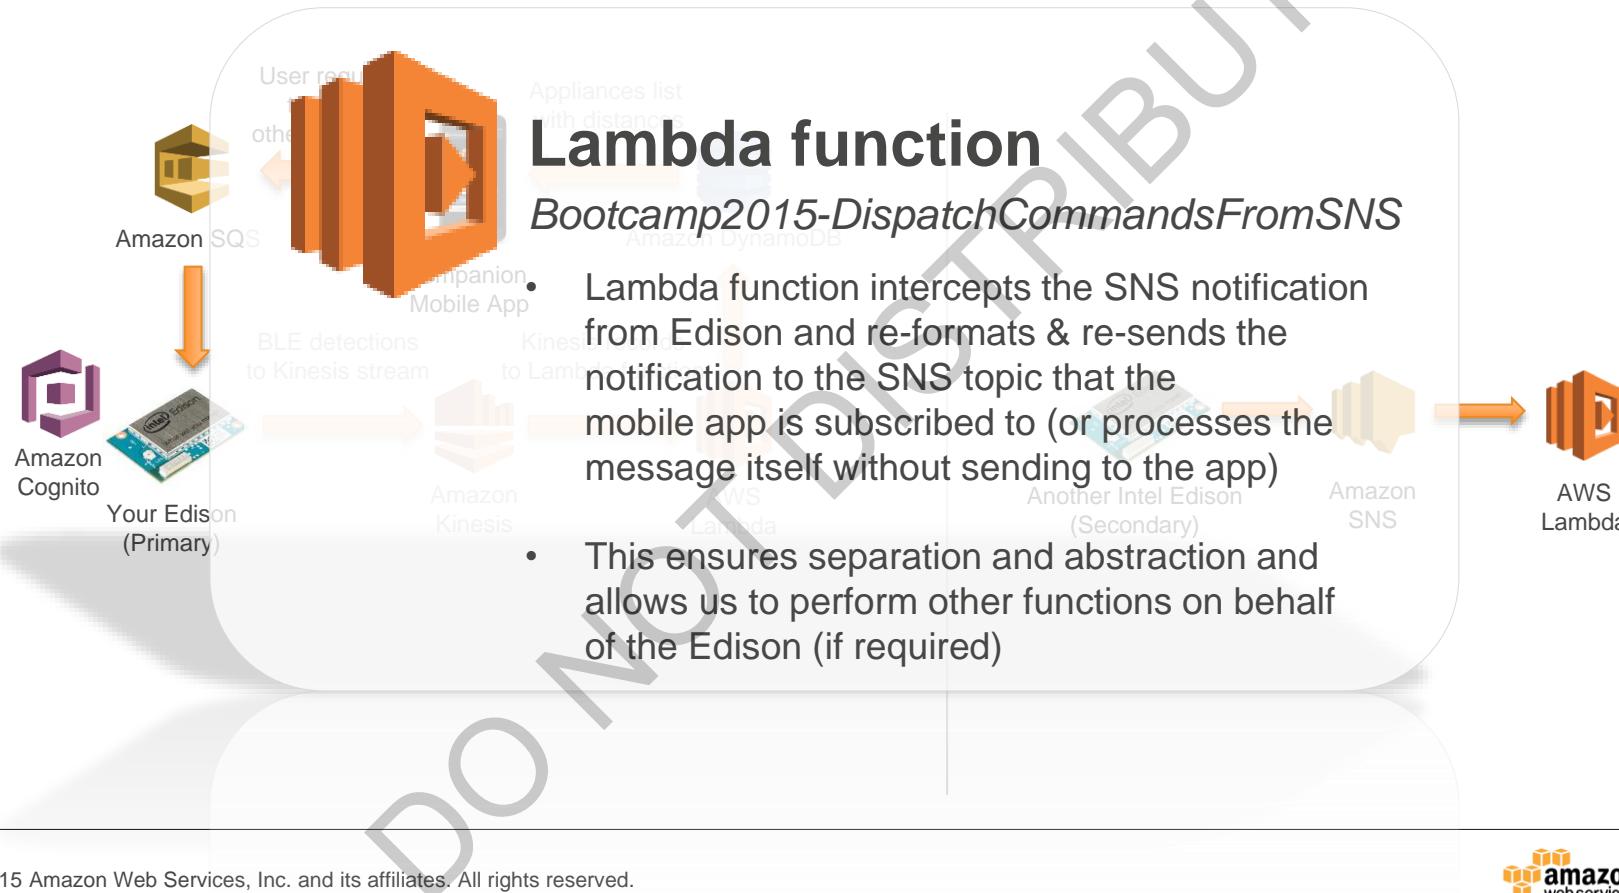

# Pairing

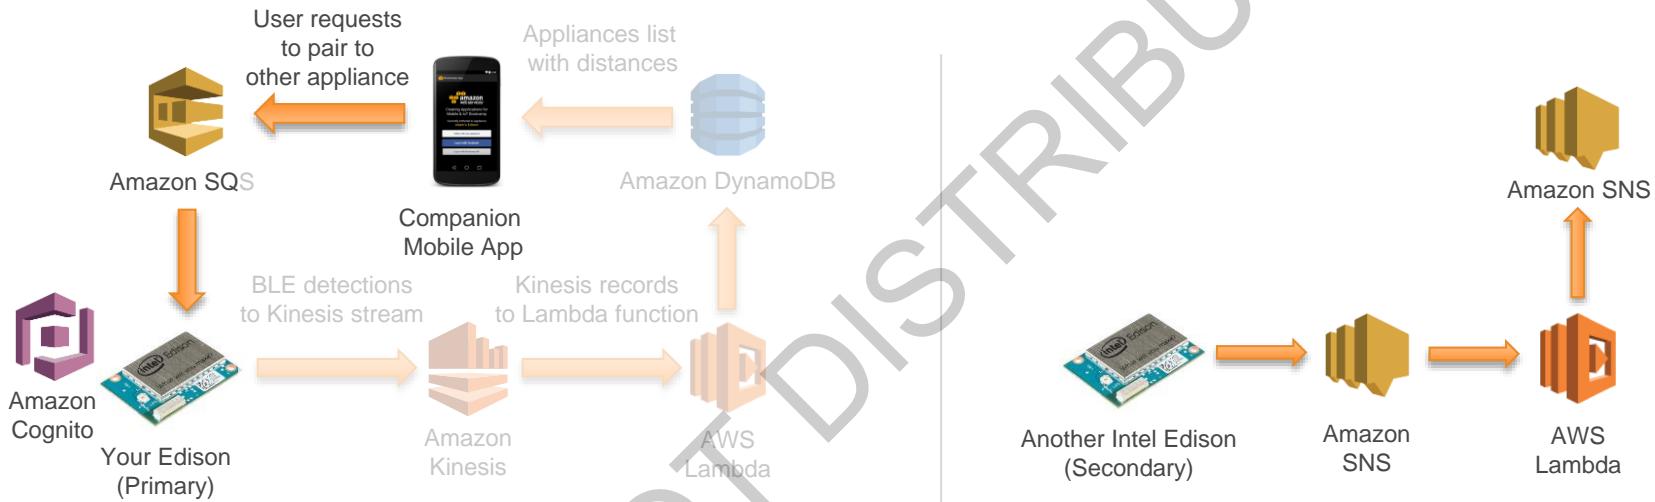

## Lambda function

*Bootcamp2015-DispatchCommandsFromSNS*

- Lambda function intercepts the SNS notification from Edison and re-formats & re-sends the notification to the SNS topic that the mobile app is subscribed to (or processes the message itself without sending to the app)
- This ensures separation and abstraction and allows us to perform other functions on behalf of the Edison (if required)

# Pairing

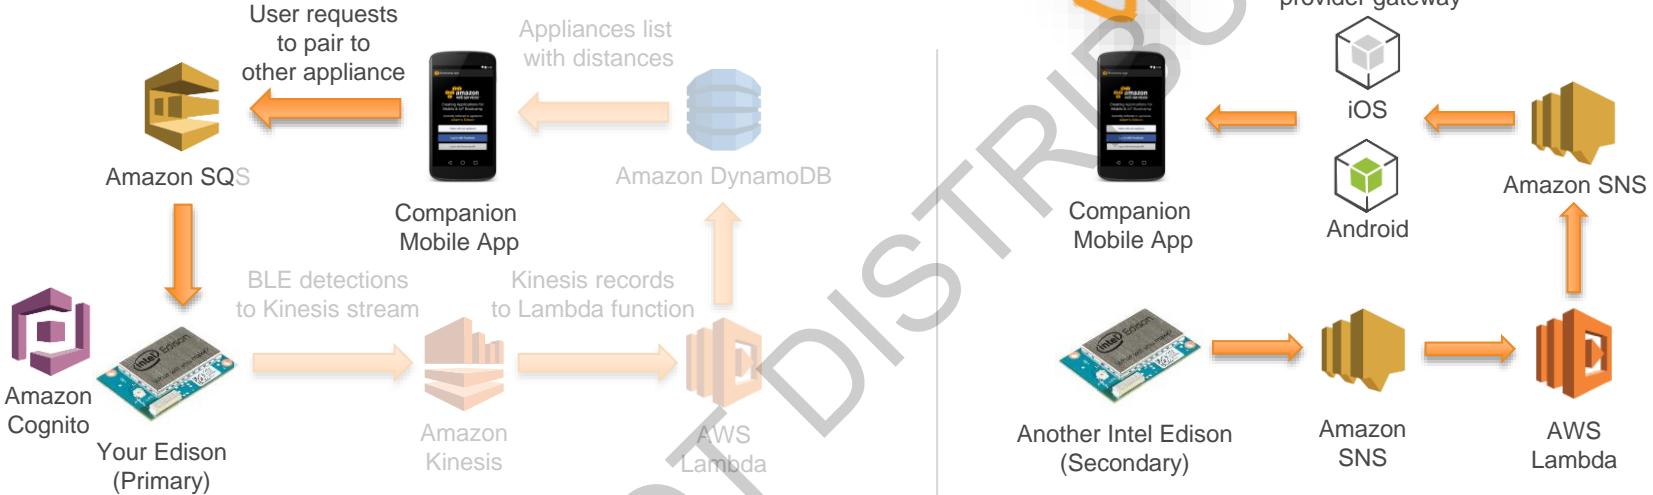

# Pairing

## SNS Topic *Bootcamp2015-To-MobileApp*

- All command traffic from Edison bound for mobile app is sent to this topic (via the Lambda function)
- Mobile app is linked to an endpoint in the platform application that is subscribed to this SNS topic
- Notifications sent to this topic will be sent as push notifications to the mobile app

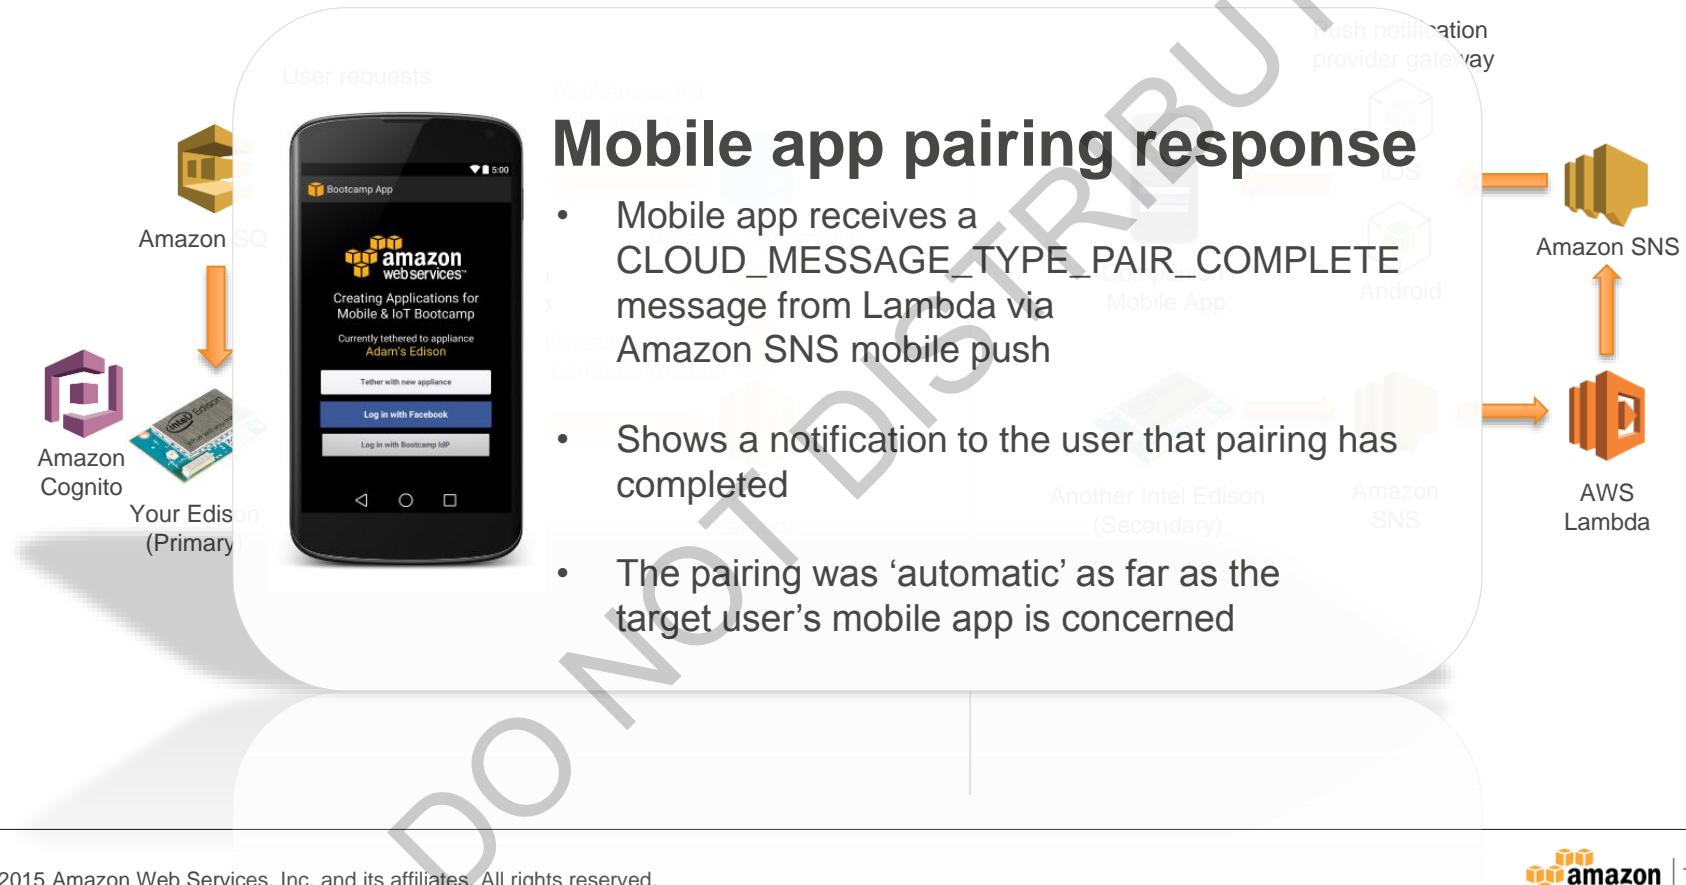

# Pairing

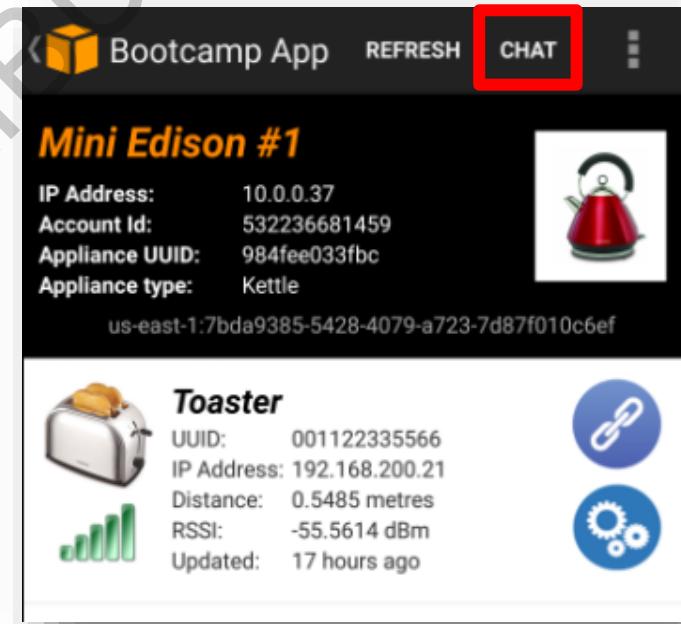

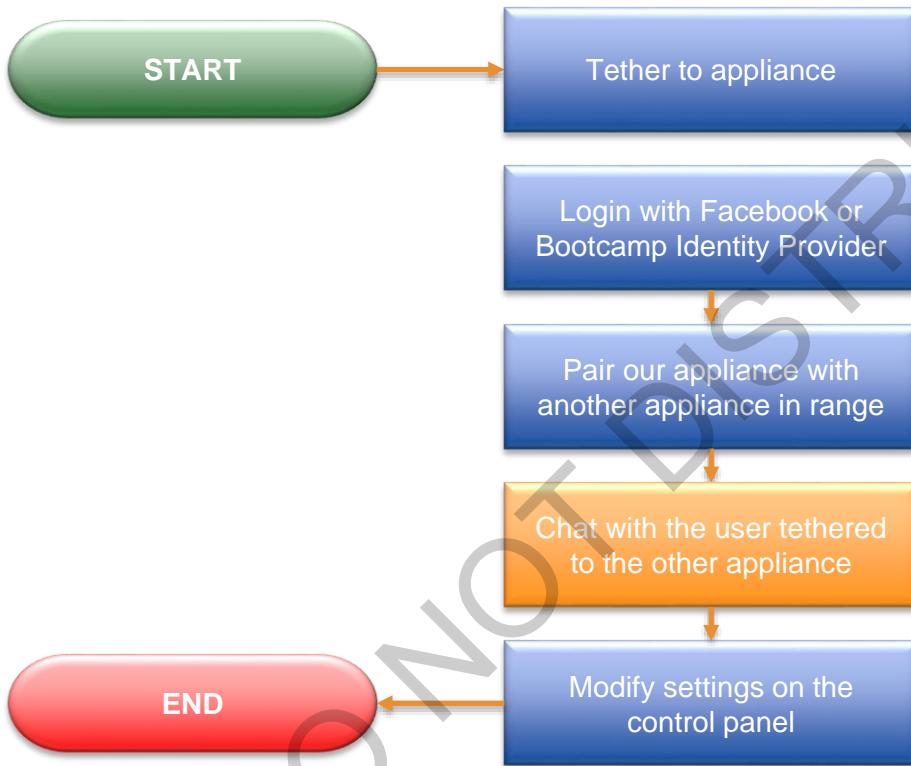

# Pairing

## Mobile app pairing response

- Mobile app receives a CLOUD\_MESSAGE\_TYPE\_PAIR\_COMPLETE message from Lambda via Amazon SNS mobile push
- Shows a notification to the user that pairing has completed
- The pairing was ‘automatic’ as far as the target user’s mobile app is concerned

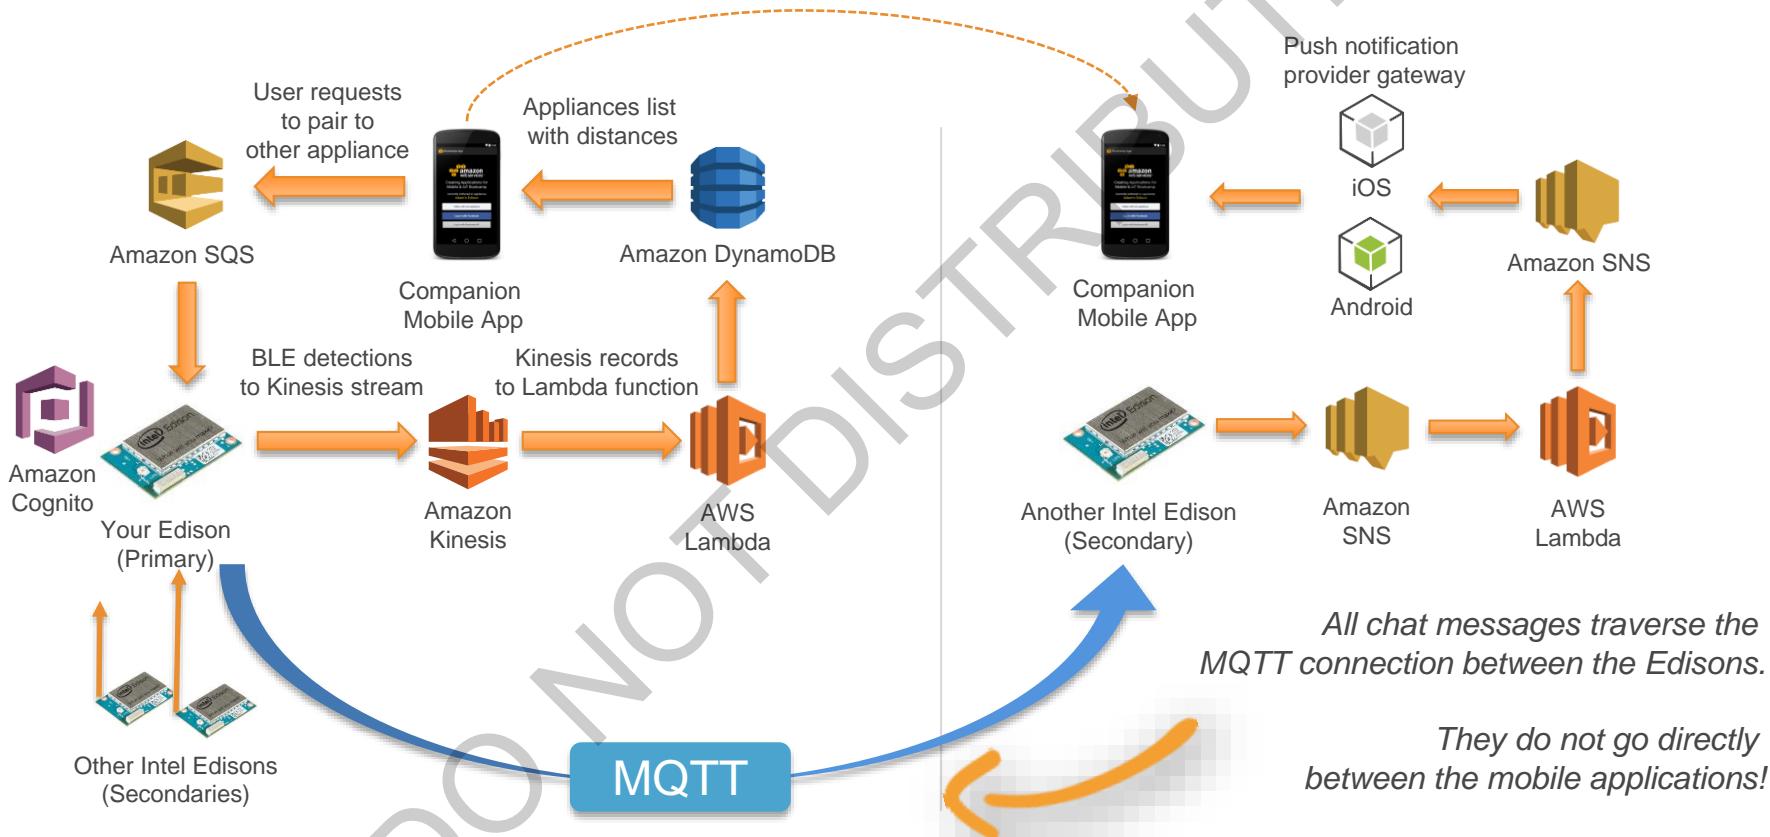

# Recap: User Workflow

# Chat

## Virtual chat channel via Intel Edison devices

# Chat

## Chat flow – same as Pairing!

- Data flow is the same as with Pairing request we just reviewed – via SQS, MQTT and SNS
- Mobile app sends via SQS a **CLOUD\_MESSAGE\_TYPE\_USER\_MESSAGE** with user payload & *messageId*

# Chat

## Chat flow – same as Pairing!

- When another mobile app receives the user message, it responds back with a **CLOUD\_MESSAGE\_TYPE\_USER\_MESSAGE\_ACK** for that *messageId* so the other mobile app can show the message as ‘received’
- Responses work in the same way, just in the opposite direction

## ■ Custom events

We send various metrics from attributes of the Control Panels to Amazon Mobile Analytics

- Toaster – keep-warm time
- Kettle –boil time

## ■ In-app purchases

We simulate in-app purchases and send the detail to Amazon Mobile Analytics so we can plot the average revenue per user

# Lab 9: How we use Amazon Mobile Analytics

```
@Override  
protected void RecordAnalytics()  
{  
    super.RecordAnalytics();  
  
    //  
    // We record the temperature and duration so we can look at some averages in the console  
    //  
    AnalyticsEvent syncEvent = Cognito.getAnalytics().getEventClient().createEvent(getPanelNameForAnalytics())  
        .withMetric("MaxTemp", (double)CalculateTemperatureSliderValueFromProgress(this.seekbar_temperature.getProgress());  
  
    Cognito.getAnalytics().getEventClient().recordEvent(syncEvent);  
  
    syncEvent = Cognito.getAnalytics().getEventClient().createEvent(getPanelNameForAnalytics())  
        .withMetric("BoilTime", (double)CalculateBoilTimeSliderValueFromProgress(this.seekbar_boiltime.getProgress()));  
  
    Cognito.getAnalytics().getEventClient().recordEvent(syncEvent);  
}
```

# Lab 9: How we use Amazon Mobile Analytics

```
protected void ChargeForPanel(String sku, String price)
{
    // get the event client from your MobileAnalyticsManager instance
    EventClient eventClient = Cognito.getAnalytics().getEventClient();

    // create a builder that can record purchase events for Google Play IAP
    GooglePlayMonetizationEventBuilder builder = GooglePlayMonetizationEventBuilder.create(eventClient);

    // build the monetization event with the product id, formatted item price,
    // transaction id, and quantity
    // product id and formatted item price can be obtained from the JSONObject
    // returned by a product sku request to Google's In App Billing API
    // transaction id is obtained from the Purchase object that is returned upon the
    // completion of a purchase
    // Google IAP currently only supports a quantity of 1
    AnalyticsEvent purchaseEvent = builder.withProductId(sku).withFormattedItemPrice(price)
        .withTransactionId( new Date().getTime() + "" ).withQuantity(1.0).build();

    // record the monetization event in mobile analytics
    eventClient.recordEvent(purchaseEvent);

    Toast.makeText(BaseControlPanel.this,
        "You have been charged $" + price + " to use this panel",
        Toast.LENGTH_LONG
    ).show();
}
```
